SN74ACT7814
64 × 18 STROBED FIRST-IN, FIRST-OUT MEMORY

- Member of the Texas Instruments Widebus™ Family
- Load Clock and Unload Clock Can Be Asynchronous or Coincident
- 64 Words by 18 Bits
- Low-Power Advanced CMOS Technology
- Full, Empty, and Half-Full Flags
- Programmable Almost-Full/Almost-Empty Flag
- Fast Access Times of 15 ns With a 50-pF Load and All Data Outputs Switching Simultaneously
- Data Rates up to 50 MHz
- 3-State Outputs
- Pin-to-Pin Compatible With SN74ACT7804 and SN74ACT7806
- Packaged in Shrink Small-Outline 300-mil Package Using 25-mil Center-to-Center Spacing

description

A FIFO memory is a storage device that allows data to be written into and read from its array at independent data rates. The SN74ACT7814 is a 64-word by 18-bit FIFO for high speed and fast access times. It processes data at rates up to 50 MHz and access times of 15 ns in a bit-parallel format.

Data is written into memory on a low-to-high transition at the load clock (LDCK) input and is read out on a low-to-high transition at the unload clock (UNCK) input. The memory is full when the number of words clocked in exceeds the number of words clocked out by 64. When the memory is full, LDCK signals have no effect on the data residing in memory. When the memory is empty, UNCK signals have no effect.

Status of the FIFO memory is monitored by the full ($\overline{\text{FULL}}$), empty ($\overline{\text{EMPTY}}$), half-full (HF), and almost-full/almost-empty (AF/AE) flags. The $\overline{\text{FULL}}$ output is low when the memory is full and high when the memory is not full. The $\overline{\text{EMPTY}}$ output is low when the memory is empty and high when it is not empty. The HF output is high when the FIFO contains 32 or more words and is low when it contains 31 or fewer words. The AF/AE status flag is a programmable flag. The first one or two low-to-high transitions of LDCK after reset are used to program the almost-empty offset value (X) and the almost-full offset value (Y) if program enable ($\overline{\text{PEN}}$) is low. The AF/AE flag is high when the FIFO contains X or fewer words or (64 – Y) or more words. The AF/AE flag is low when the FIFO contains between (X + 1) and (63 – Y) words.
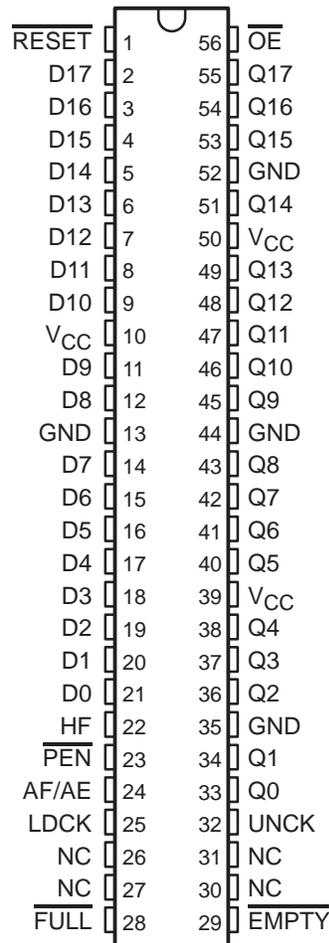

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

1

description (continued)

A low level on the reset ($\overline{\text{RESET}}$) input resets the internal stack pointers and sets $\overline{\text{FULL}}$ high, HF low, and $\overline{\text{EMPTY}}$ low. The Q outputs are not reset to any specific logic level. The FIFO must be reset upon power up. The first word loaded into empty memory causes $\overline{\text{EMPTY}}$ to go high and the data to appear on the Q outputs. It is important to note that the first word does not have to be unloaded. The data outputs are noninverting with respect to the data inputs and are in the high-impedance state when the output-enable ($\overline{\text{OE}}$) input is high.
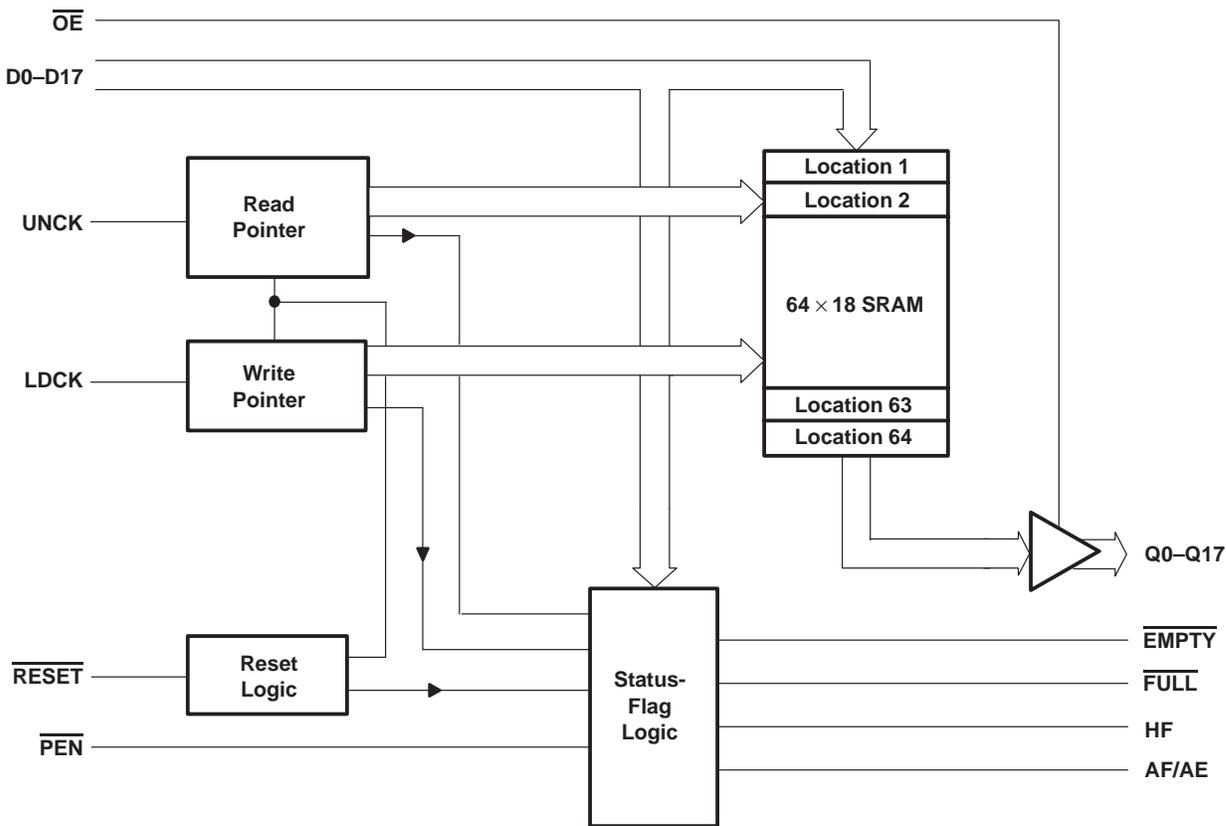

The SN74ACT7814 is characterized for operation from 0°C to 70°C.

functional block diagram

Terminal Functions

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
AF/AE	24	O	Almost-full/almost-empty flag. Depth-offset values can be programmed for AF/AE, or the default value of 8 can be used for both the almost-empty offset (X) and the almost-full offset (Y). AF/AE is high when memory contains X or fewer words or (64 – Y) or more words. AF/AE is high after reset.
D0–D17	2–9, 11–12, 14–21	I	18-bit data input port
$\overline{\text{EMPTY}}$	29	O	Empty flag. $\overline{\text{EMPTY}}$ is high when the FIFO memory is not empty; $\overline{\text{EMPTY}}$ is low when the FIFO memory is empty or upon assertion of $\overline{\text{RESET}}$.
$\overline{\text{FULL}}$	28	O	Full flag. $\overline{\text{FULL}}$ is high when the FIFO memory is not full or upon assertion of $\overline{\text{RESET}}$; $\overline{\text{FULL}}$ is low when the FIFO memory is full.
HF	22	O	Half-full flag. HF is high when the FIFO memory contains 32 or more words. HF is low after reset.
LDCK	25	I	Load clock. Data is written to the FIFO on the rising edge of LDCK when $\overline{\text{FULL}}$ is high.
$\overline{\text{OE}}$	56	I	Output enable. When $\overline{\text{OE}}$ is high, the data outputs are in the high-impedance state.
$\overline{\text{PEN}}$	23	I	Program enable. After reset and before the first word is written to the FIFO, the binary value on D0–D4 is latched as an AF/AE offset value when $\overline{\text{PEN}}$ is low and WRTCLK is high.
Q0–Q17	33–34, 36–38, 40–43, 45–49, 51, 53–55	O	18-bit data output port
$\overline{\text{RESET}}$	1	I	Reset. A low level on $\overline{\text{RESET}}$ resets the FIFO and drives $\overline{\text{FULL}}$ high and HF and $\overline{\text{EMPTY}}$ low.
UNCK	32	I	Unload clock. Data is read from the FIFO on the rising edge of UNCK when $\overline{\text{EMPTY}}$ is high.

offset values for AF/AE

The AF/AE flag has two programmable limits: the almost-empty offset value (X) and the almost-full offset value (Y). They can be programmed after the FIFO is reset and before the first word is written to memory. The AF/AE flag is high when the FIFO contains X or fewer words or (64 − Y) or more words.

To program the offset values, $\overline{PEN}$ can be brought low after reset only when LDCK is low. On the following low-to-high transition of LDCK, the binary value on D0–D4 is stored as the almost-empty offset value (X) and the almost-full offset value (Y). Holding $\overline{PEN}$ low for another low-to-high transition of LDCK reprograms Y to the binary value on D0–D4 at the time of the second LDCK low-to-high transition. Writes to the FIFO memory are disabled while the offsets are programmed. A maximum value of 31 can be programmed for either X or Y (see Figure 1). To use the default values of X = Y = 8, $\overline{PEN}$ must be held high.

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Supply voltage range, V_{CC} .... –0.5 V to 7 V
Input voltage range, V_I .... –0.5 V to 7 V
Voltage range applied to a disabled 3-state output .... –0.5 V to 5.5 V
Package thermal impedance, θ_{JA} (see Note 1) .... 74°C/W
Storage temperature range, T_{stg} .... –65°C to 150°C

† Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and
 functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not
 implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
NOTE 1: The package thermal impedance is calculated in accordance with JESD 51.

SN74ACT7814-40DL.A	Active	Production	SSOP (DL) | 56	20 | TUBE	Yes	NIPDAU	Level-1-260C-UNLIM	0 to 70	ACT7814-40

(1) Status: For more details on status, see our product life cycle.

(2) Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
