

NCN7200

Data Switch, Gigabit Ethernet LAN, with 2:1 Mux/ DeMux and Power-Down Feature

The NCN7200 is pin-compatible to the PI3L720ZHE and comes in a 42-pin WQFN package (3.5 mm x 9 mm x 0.5 mm Pitch). The NCN7200 is an 8-channel, bidirectional switch with a power shutdown feature that puts all outputs in a high-impedance state. The switch is compatible with 10/100/1000 Base-T Ethernet standards. The device has 3 additional lines for status indicator LEDs which are switched together with the Ethernet pairs.

Features

- 2:1 Mux/ DeMux LAN Switch
- Three Extra Channels Facilitate LED Switching
- Fully Specified for Power Supply Range: 3 V to 3.6 V
- Powerdown Feature Conserves Energy
- ESD Protection
 - ◆ 8 kV HBM (Human Body Model, I/O to GND)
 - ◆ 10 kV Contact Discharge (IEC61000-4-2)
- Low Crosstalk: -70 dB
- Pin-to-Pin Replacement for PI3L720ZHE
- This is a Pb-Free Device

Typical Applications

- Routes signals for 10/100/1000 Mbps Ethernet
- Facilitates Docking System by Interfacing One Controller to Dual Connectors

**Figure 2. Pin Description
(Top View)**

PIN DESCRIPTION

Pin Name	Description
AX+, AX-	Port A DeMux I/O
BX+, BX-	Port B Mux I/O
CX+, CX-	Port C LED Mux I/O
GND	Ground
LEDZX	LED I/O
PD	Powerdown, Active high, with internal pulldown resistor
SEL	Select
V _{DD}	Power

MAXIMUM RATINGS

Description	Value	Unit
Storage Temperature	-65 to +150	°C
Supply Voltage to Ground Potential	-0.5 to +4.0	V
DC Input Voltage	-0.5 to +5.5	V
DC Output Current (Note 1)	120	mA
Power Dissipation (Note 1)	0.5	W

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. Continuous short-circuit operation to ground at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of 150°C. Output currents in excess of 45 mA over long term may adversely affect reliability. Shorting output to either V+ or V- will adversely affect reliability.

GIGABIT ETHERNET LAN SWITCH WITH 2:1 MUX/ DEMUX AND POWER DOWN FEATURE

(Min / Max values are at V_{DD} = 3.3 V ±10%, T_A = -40°C to +85°C. Typ values are at V_{DD} = 3.3 V and T_A = 25°C)

Symbol	Description	Test Conditions	Min	Typ	Max	Unit
--------	-------------	-----------------	-----	-----	-----	------

POWER SUPPLY CHARACTERISTICS (Note 2)

V _{DD}	Power DC Supply Voltage		3.0	3.3	3.6	V
I _{DD-Standby}	Quiescent Power Supply Current	V _{DD} = 3.6 V, V _{IN} = GND or V _{DD}		0.38	0.45	mA
I _{DD-Active}	Active Power Supply Current	V _{DD} = 3.6 V, V _{IN} = V _{DD} or GND		1.0	1.5	mA
I _{DD-PD}	Power Down Current	P _D = 1, V _{DD} = 3.6 V, V _{IN} = V _{DD} or GND		0.13	0.16	mA

2. Active power represents normal data communication. Standby power is when the device is enabled for operation but there is no LAN traffic (cable not connected). Power down current is the minimum power state used when not connected and mobile.
3. Measured by the voltage drop between A and B pins at indicated current through the switch. ON resistance is determined by the lower of the voltages on the two (A & B) pins.
4. Guaranteed by design and/or characterization.
5. The bus switch contributes no propagational delay other than the RC delay of the ON resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.25 ns for 10 pF load. Since this time constant is much smaller than the rise/fall times of typical driving signals, it adds very little propagational delay to the system. Propagational delay of the bus switch when used in a system is determined by the driving circuit on the driving side of the switch and its interactions with the load on the driven side.

Figure 7. Off-Isolation

$$\text{Differential Crosstalk} = 20\log\left(\frac{V_{OUT+} - V_{OUT-}}{V_{IN+} - V_{IN-}}\right)$$

Measurements are standardized against shorts at IC terminals.
Differential Crosstalk is measured between any two non-adjacent pairs.

Figure 8. Differential Crosstalk

NCN7200

APPLICATION INFORMATION

Logic Inputs

The logic control inputs can be driven up to +3.6 V regardless of the supply voltage. For example, given a +3.3 V supply, the output enables or select pins may be driven low to 0 V and high to 3.6 V: driving the control pins to the rails minimizes power consumption.

Power-Supply Sequencing

Proper power-supply sequencing is advised for all CMOS devices. It is recommended to always apply V_{DD} before applying signals to the input/output or control pins.
