

MPQ7228

16-Channel Current Sink LED Driver with Adaptive Feedback Control (AFC) and UART Interface, AEC-Q100 Qualified

DESCRIPTION

The MPQ7228 is a 16-channel current sink LED driver. Each channel is rated for up to 200mA of current, and 16 ICs can be cascaded together to create a 256-channel solution.

The MPQ7228 is optimized for animated or dynamic lighting applications. It employs 12-bit pulse-width modulation (PWM) dimming and 6-bit analog dimming register per channel, with individual control of each channel. The MPQ7228 features a universal asynchronous receiver-transmitter (UART) communication protocol, allowing for robust communication from a host MCU.

The MPQ7228 features adaptive feedback control (AFC) to maximize system efficiency. The output voltage of the pre-regulator (e.g. buck voltage regulator) is adjusted in real time so that the voltage across the channels is kept at a minimum value (typically 300mV headroom at 200mA).

Frequency spread spectrum (FSS) optimizes EMC performance. The LED current's ramping rate and the phase shift between channels can be digitally configured as well.

The MPQ7228 can aid a system design for functional safety with a failsafe (/FS) indicator. The full protection suite includes LED open/short protection, ISET pin open/short protection, and thermal shutdown. If a fault condition occurs, the fault indicator pulls low, and the matching fault register is set.

The MPQ7228 is available in a QFN-32 (5mmx6mm) package. It is AEC-Q100 qualified.

FEATURES

- Scalability
 - 16 Channels, 200mA/Channel (Max Current)
 - Cascade up to 16 ICs for up to 256 Channels
 - Pin-Configurable Device Address
- Designed for Automotive Applications
 - Supports 2.5V Cold Crank

FEATURES (continued)

- -40°C to +150°C Operating Junction Temperature (T_j) Range
- Cooler Thermals and Optimized Efficiency
 - Adaptive Feedback Control (AFC) Dynamically Optimizes Pre-Regulator Output
 - 300mV Current Sink Headroom at 200mA
 - Headroom Optimization for Multiple ICs
- Robust Communication
 - 2Mbps UART-Compatible Interface
 - 12-Bit Pulse-Width Modulation (PWM) Dimming or 6-Bit Analog Dimming for Each Channel
- Optimized for EMI/EMC Reduction
 - Configurable Phase Shift and Slew Rate
 - Frequency Spread Spectrum (FSS) (Internal Clock)
 - Selectable PWM Dimming Frequency
 - CISPR25 Class 5 Compliant
- Additional Features
 - Functional Safety Document Available to Support System in Achieving ASIL Requirements
 - Failsafe (/FS) Pin and Fault Registers for System Protection and Diagnostics
 - LED Short (to GND and Battery)
 - LED Open
 - Thermal Warning and Shutdown
 - ISET Pin Open/Short
- One-Time Programmable (OTP) Memory
- Available in a QFN-32 (5mmx6mm) Package with Wettable Flanks
- Available in AEC-Q100 Grade 1

APPLICATIONS

- Dynamic/Animated Tail Lights
- Adaptive Matrix Headlights
- Daytime Running Lights (DRLs)
- Turn Signals and Puddle Lights

All MPS parts are lead-free, halogen-free, and adhere to the RoHS directive. For MPS green status, please visit the MPS website under Quality Assurance. "MPS", the MPS logo, and "Simple, Easy Solutions" are trademarks of Monolithic Power Systems, Inc. or its subsidiaries.

TYPICAL APPLICATION

ORDERING INFORMATION

Part Number*	Package	Top Marking	MSL Rating**
MPQ7228GQJE-xxxx-AEC1***, ****	QFN-32 (5mmx6mm)	See Below	2

* For Tape & Reel, add suffix -Z (e.g. MPQ7228GQJE-xxxx-AEC1-Z).

** Moisture Sensitivity Level Rating

*** “xxxx” is the configuration code identifier for the register settings stored in the OTP register. Each “x” can be a hexadecimal value between 0 and F. The default code is “0000”. Contact an MPS FAE to create this unique number.

LLLLLLL: Lot number
E: Wettable flank

PACKAGE REFERENCE

PIN FUNCTIONS

Pin #	Name	Description
1	VCC	Internal bias supply. The VCC pin is powered from VBIAS, and it supplies power to the internal control circuit and gate drivers. Place a $\geq 10\mu\text{F}$ decoupling capacitor from VCC to ground, and close to VCC. VCC needs power from an external source if the VBIAS voltage (V_{BIAS}) is below 3.5V.
2	FBI	Feedback input. The FBI pin indicates the current sink headroom information input between multiple MPQ7228 devices. Connect FBI to GND if it is not used.
3, 10, 15, 22	GND	Ground. GND is the reference ground of the power device, and requires careful consideration during PCB layout.
4, 5, 6, 7, 8, 9, 11, 12, 13, 14, 16, 17, 18, 19, 20, 21	LED1–LED16	LED channel 1–16 current inputs. Connect the cathodes of LED channels 1–16 to these pins. Connect the LEDx pin to GND if it is not used, and disable LEDx through the CHx_EN (0x03) register.
23	FBO	Feedback output. Connect the FBO pin to the DC/DC converter's feedback pin through a resistor divider network. FBO is used as the current sink headroom information output between multiple MPQ7228 devices. Float this pin if adaptive feedback control (AFC) is not used.
24	ISSET	LED current set. Connect an external resistor from ISET to ground to set the LED average current. The LED current (I_{LED}) for each channel(mA) = $600 / R_{\text{ISET}}$ (k Ω). If the ISET pin is shorted to ground or an open condition is detected, the device latches off and asserts /FS.
25	TX	Transmitted data pins. Connect the device's TX pin to the microcontroller unit's RX input. Pull TX up to VCC using a 2k Ω resistor.
26	RX	Received data pins. Connect the device's RX pin to the microcontroller unit's TX output.
27	ADDR2	Address setting. Configure the device's address by connecting this pin to VCC/GND or to GND using a 35k Ω resistor (with $\pm 10\%$ range). For more details, see the Device Address section on page 27.
28	ADDR1	Address setting. Configure the device's address by connecting this pin to VCC/GND or to GND using a 35k Ω resistor (with $\pm 10\%$ range). For more details, see the Device Address section on page 27.
29	/FS	Failsafe output. The /FS pin is an active-low, open-drain output. /FS pulls low if any of the following occur: LED short, LED open, thermal shutdown, and ISET pin open or short. The /FS pin can support a continuous connection to VBIAS or VCC through a pull-up resistor. Float this pin if it is not used.
30	EN	Enable input. Pull EN above 2.2V to enable the part; pull EN below 0.8V to shut down the part. The EN pin can be directly pulled to VBIAS through a resistor.
31	VBIAS	Bias supply. The MPQ7228 operates from a 2.5V to 18V input rail. A capacitor (C_{IN}) is required, and it must be placed close to VBIAS to decouple the input rail.
32	MODE	Mode selection. The MODE pin is the master/slave mode selection pin. Tie MODE to GND to configure master mode, or tie MODE to VCC to configure slave mode. If AFC is not used, connect all devices' MODE pins to GND.
-	Exposed pad	Exposed thermal pad. The exposed pad has no internal electrical connection to GND. Connect the exposed pad to the external GND plane on the board for optimal thermal performance.

ABSOLUTE MAXIMUM RATINGS ⁽¹⁾

V _{BIAS}	-0.3V to +20V
V _{LEDX}	-0.3V to +20V
FBO, EN, /FS	-0.3V to +20V
All other pins	-0.3V to +4V
Continuous power dissipation (T _A = 25°C) ^{(2) (6)}	
QFN-32 (5mmx6mm)	5.9W
Junction temperature (T _J)	150°C
Lead temperature	260°C
Storage temperature	-65°C to +150°C

ESD Ratings

Human body model (HBM)	Class 2 ⁽³⁾
Charged-device model (CDM)	Class C2b ⁽⁴⁾

Recommended Operating Conditions

VCC (if externally supplied)	3.2V to 3.5V
VBIAS voltage (V _{BIAS})	2.5V to 18V
LED current (I _{LED})	200mA/channel
Operating junction temperature (T _J)	
.....	-40°C to +150°C

Thermal Resistance θ_{JA} θ_{JC}

QFN-32 (5mmx6mm)		
JESD51-7	23.8	1.4 ... °C/W ⁽⁵⁾
EVQ7228-QJ-00A	21.2	0.93 ... °C/W ⁽⁶⁾

Notes:

- 1) Exceeding these ratings may damage the device.
- 2) The maximum allowable power dissipation is a function of the maximum junction temperature, T_J (MAX), the junction-to-ambient thermal resistance, θ_{JA} , and the ambient temperature, T_A. The maximum allowable continuous power dissipation at any ambient temperature is calculated by P_D (MAX) = (T_J (MAX) - T_A) / θ_{JA} . Exceeding the maximum allowable power dissipation can cause excessive die temperature, and the regulator may go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- 3) Per AEC-Q100-002.
- 4) Per AEC-Q100-011.
- 5) Measured on a JESD51-7, 4-layer PCB. The values given in this table are only valid for comparison with other packages and cannot be used for design purposes. These values were calculated in accordance with JESD51-7, and simulated on a specified JEDEC board. They do not represent the performance obtained in an actual application. The value of θ_{JC} shows the thermal resistance from junction-to-case bottom.
- 6) Measured on a standard EVB for the MPQ7228: 83.5mmx83.5mm size, 4-layer PCB, 2oz. The value of θ_{JC} shows the thermal resistance from junction-to-case top.

ELECTRICAL CHARACTERISTICS

$V_{BIAS} = 6.5V$, $T_J = -40^{\circ}C$ to $+150^{\circ}C$, typical values are at $T_J = 25^{\circ}C$, unless otherwise noted.

Parameter	Symbol	Condition	Min	Typ	Max	Units
Supply Voltage						
VBIAS pin supply current	I_{VBIAS}	Disabled, EN pin is low (shutdown)		0.5	2.5	μA
		Enabled, no LED load (EN pin is high, EN_ANA bit = 0, quiescent current [I_Q]), VCC externally supplied, $V_{BIAS} = 6.5V$		0.6	1	mA
		Enabled, no LED load (EN pin is high, EN_ANA bit = 0, I_Q), VCC is externally supplied, $V_{BIAS} = 14V$		1.4	2.1	mA
		Enabled, no LED load (EN pin is high, EN_ANA bit = 0, I_Q), VCC is internally supplied, $V_{BIAS} = 6.5V$		7	12	mA
		Enabled, no LED load (EN pin is high, EN_ANA bit = 0, I_Q), VCC is internally supplied, $V_{BIAS} = 14V$		8	13	mA
VBIAS voltage (V_{BIAS}) under-voltage lockout (UVLO) threshold	V_{BIAS_UVLO}	Rising edge		1.8		V
		Falling edge		1.6		V
VCC supply current	I_{CC}	Only required if VCC is externally supplied	Disabled, EN pin is low (shutdown), $V_{CC} = 3.5V$	0.05	60	μA
			$V_{CC} = 3.5V$, enabled, no LED load (EN pin is high, I_Q)	6.5	13	mA
			$V_{CC} = 3.5V$, 16 LED channels are enabled (EN pin is high, EN_ANA bit = 1, PWM = 100%, $R_{ISET} = 6.04k\Omega$, $I_{LED} = 100mA$)	12	20	mA
Internal VCC regulator voltage	V_{CC}	$I_{VCC} = 0mA$	3.1	3.3	3.5	V
VCC UVLO threshold	V_{CC_UVLO}	Rising edge	2.8	3	3.2	V
		Falling edge	2.6	2.8	3	V

FUNCTIONAL BLOCK DIAGRAM

Figure 1: Functional Block Diagram

OPERATION

LED Current Sinks

The current sink regulators (16 channels) embedded in the MPQ7228 can be individually configured to provide up to a maximum current of 200mA for each channel. These 16 specialized current sinks are accurate to within $\pm 5\%$ for currents at 200mA across the entire temperature range, with a string-to-string difference of $\pm 5\%$.

Pre-Regulator Adaptive Feedback Control (AFC)

The MPQ7228 features adaptive feedback control (AFC) for the external pre-regulator. The output voltage (V_{BIAS}) of the pre-regulator (e.g. the buck) is always self-adjusted based on the LED string with the lowest headroom voltage. This minimizes the LEDx pin voltage (V_{LEDx}) and maintains the target LED current (I_{LED}) for the 16 channels. Overall efficiency is maximized when the MPQ7228's current sinks operate with the minimum headroom voltage.

The number of used LED outputs are automatically detected, and only the active LED outputs are monitored for AFC. If any LED strings are not used, they can be disabled via the one-time programmable (OTP) memory using CHx_EN (0x03).

V_{LEDx} is periodically monitored by the control loop. If any of the LED outputs fall below the low-band threshold (0.45V), the external pre-regulator's output voltage increases. If all LED outputs exceed the high-band threshold (0.55V), the external pre-regulator's output decreases.

V_{LEDx} should remain between the low band and high band. The band can be configured via register 0x27 based on I_{LED} . The high-band voltage can be set between 0.25V and 0.6V, while the low-band voltage can be set between 0.2V and 0.55V. If $150mA < I_{LED} \leq 200mA$, it is recommended to set the overall band between 0.45V and 0.55V. If $I_{LED} \leq 150mA$, it is recommended to set the overall band between 0.3V and 0.4V to improve efficiency.

The initial V_{BIAS} voltage (V_{BIAS}) can also be configured via the OTP. The internal resistor divider (R1 and R2) defines both the minimum and maximum adaptive V_{BIAS} levels (see Figure 4 on page 25).

Choose the maximum V_{BIAS} based on the maximum LED string voltage specification. Before the LED drivers are active, the initial pre-regulator output voltage exceeds the maximum LED string voltage by about 0.3V.

One of the MPQ7228's key benefits is that its dropout information can be transferred to the DC/DC converter's feedback pin via the FBO pin to optimize system efficiency in real time. This information sharing is also available between multiple MPQ7228 devices via the FBI and FBO pins. The channel with the lowest V_{LEDx} uses its V_{LEDx} to determine the DC/DC converter's power supply output. AFC also works if multiple MPQ7228 devices are connected in parallel.

Figure 2 shows when V_{BIAS} is set with AFC.

Figure 2: V_{BIAS} with AFC

Figure 3 shows when V_{BIAS} has a fixed voltage ($V_{LEDx} = 1V$) without AFC.

Figure 3: V_{BIAS} without AFC

AFC improves both thermal performance and efficiency. When $I_{LED} = 200mA$, the temperature deviation is about $38.3^{\circ}C$.

If AFC is not used, float the MPQ7228's FBO and MODE pins, and connect the FBI pin to GND.

Multiple Devices

The MPQ7228 can also support several devices in parallel by setting the part to master mode or slave mode through the MODE pin. If the MODE pin is connected to GND, the part is configured as the master. The slave device's FBO pin should be connected to the master's FBI pin. If the MODE pin is connected to VCC, the part is configured as a slave. The FBO pin of the master is connected to the pre-regulator's feedback resistor divider (see Figure 4). Only the master device can directly adjust the V_{BIAS} ; the slave chip can only deliver the V_{BIAS} information to master device through the FBI pin.

For the master device, the FBI pin voltage (V_{FBI}) and V_{LEDx} determine how to adjust V_{BIAS} . If the high band is set to 0.55V and the low band is set to 0.45V, and $0.75V < V_{FBI} < 1.2V$ (or any of the master devices' $V_{LEDx} < 0.45V$), the chip decreases R2. This decreases the FBO voltage (V_{FBO}), which regulates V_{BIAS} to high by the pre-regulator. If $V_{FBI} < 0.3V$ and all the masters' $V_{LEDx} > 0.55V$, the chip increases R2. This increases V_{FBO} , which regulates V_{BIAS} to low by the pre-

regulator. For other conditions, V_{BIAS} is maintained as normal.

Refer to the FBI detector. When $0.75V < V_{FBI} < 1.2V$, $UP_S = 1$, and $DOWN_S = 0$, this means that V_{BIAS} is not sufficient for the slave device, so V_{BIAS} must be increased for the slave device. When $V_{FBI} < 0.3V$, $DOWN_S = 1$, and $UP_S = 0$, this means that V_{BIAS} is too high for the slave device, so V_{BIAS} must be decreased. When $0.3V < V_{FBI} < 0.75V$, $UP_S = 0$, and $DOWN_S = 0$, this means that V_{BIAS} must stay the same for the slave device.

For any slave device, if $V_{LEDx} < 0.45V$, or $0.75 < V_{FBI} < 1.2V$, then $V_{FBO} = 1V$ (V_{BIAS} is not sufficient; increase V_{BIAS} for the slave device). If all $V_{LEDx} > 0.55V$ and $V_{FBI} < 0.3V$, then $V_{FBO} = 0V$ (V_{BIAS} is too high; decrease V_{BIAS} for the slave device); for other conditions, $V_{FBO} = 0.5V$ (maintain V_{BIAS} for the slave device).

In summary, if $V_{LEDx} < 0.45V$, then V_{BIAS} increases; V_{BIAS} decreases only when each $V_{LEDx} > 0.55V$. For other conditions, V_{BIAS} stays the same. Table 1 summarizes these relationships.

Table 1: Relationship between FBI, FBO, V_{BIAS} , and V_{LEDx}

Slave Device			
Condition	Any $V_{LEDx} < 0.45$ or $0.75 < V_{FBI} < 1.2V$	All $V_{LEDx} > 0.55V$ and $V_{FBI} < 0.3V$	Other condition
V_{FBO}	1V	0V	0.5V
Master Device			
Condition	Any $V_{LEDx} < 0.45$ or $0.75 < V_{FBI} < 1.2V$	All $V_{LEDx} > 0.55V$ and $V_{FBI} < 0.3V$	Other condition
V_{FBO}	Decreases	Increases	Stays the same
V_{BIAS}	Increases	Decreases	Stays the same

Figure 4 shows how to set up the master and slave modes.

Figure 4: Master and Slave Mode Set-Up

Device Address

The device address is configured via ADDR1,

ADDR2, and the SADDR_PAGE bit. A total of 16 different addresses can be configured (see Table 2).

Table 2: Address Setting

ADDR2	ADDR1	SADDR_PAGE	Bits[3:0]
Connect to VCC	Connect to VCC	0	0000
Connect to VCC	Connect R = 35kΩ to GND	0	0001
Connect to VCC	Connect to GND	0	0010
Connect R = 35kΩ to GND	Connect to VCC	0	0011
Connect R = 35kΩ to GND	Connect R = 35kΩ to GND	0	0100
Connect R = 35kΩ to GND	Connect to GND	0	0101
Connect to GND	Connect to VCC	0	0110
Connect to GND	Connect R = 35kΩ to GND	0	0111
Connect to GND	Connect to GND	0	1000
Connect to GND	Connect to GND	1	1000
Connect to VCC	Connect to VCC	1	1000
Connect to VCC	Connect R = 35kΩ to GND	1	1001
Connect to VCC	Connect to GND	1	1010
Connect R = 35kΩ to GND	Connect to VCC	1	1011
Connect R = 35kΩ to GND	Connect R = 35kΩ to GND	1	1100
Connect R = 35kΩ to GND	Connect to GND	1	1101
Connect to GND	Connect to VCC	1	1110
Connect to GND	Connect R = 35kΩ to GND	1	1111

At start-up, the IC checks the address first. Once the address is checked, the address is maintained during operation unless there is a power-on reset (POR). Note that the 35kΩ resistor must be within the $\pm 10\%$ range. If SADDR_PAGE is set to 0 via the OTP, the solution can support a maximum of 9 devices in one system. To use more than 9 devices, set SADDR_PAGE to 1.

Enable (EN) and Start-Up

The EN pin can be connected to VBIAS through a resistor, or it can be controlled by the MCU's I/O pin. Pull EN above 2.2V to enable the part; pull EN below 0.8V to disable the part.

If using VBIAS to power VCC, the VCC voltage (V_{CC}) does not rise until V_{BIAS} and EN are high. Then the internal logic circuits, including the differential interface, are active. The start-up sequence is as follows:

- V_{BIAS} and EN pull high.
- V_{CC} exceeds its UVLO threshold.
- Internal logic circuits are active and provide the output to the LEDs.

Each channel can be enabled or disabled individually by setting the corresponding ChxEN bit (register address: 0x03) to “disabled.”

Figure 5 shows the start-up sequence. This sequence is described in greater detail below.

Figure 5: Start-Up Sequence

t1: The delay time from EN going high to $V_{CC} > V_{CC_UVLO}$ is about 200μs, which is based on the 10μF VCC capacitor.

t2: The delay time from V_{CC} rising to when the internal logic is ready is about 5.5ms.

If $V_{BIAS} < 3.5V$, another external LDO is required to power VCC. Set the external LDO voltage to 3.3V and with a current ability $> (n \times 20mA + 50mA)$, where n is the number of MPQ7228 devices in the system.

If using a buck converter as the MPQ7228's pre-regulator, the FBO pin must be connected to the pre-regulator's FB pin through a divider network. In this scenario, start-up should follow the sequence below:

- Power the MPQ7228's VCC pin with an external 3.3V LDO.
- The MPQ7228's EN pin goes high.
- Start up the pre-regulator.

Figure 6 shows this start-up sequence. This sequence is described in greater detail below.

Figure 6: Start-Up Sequence

t1: The IC needs 500μs to load the OTP. It is recommended to wait longer than 500μs to initially start up the MPQ7228 or the buck converter.

t2: This time period is based on the buck's start-up delay.

If VBIAS is disconnected from the pre-regulator, or the FBO pin is disconnected from the FB divider, then the pre-regulator works at a maximum duty cycle, and the output voltage is regulated to the input voltage. Then all LEDx pins detect an LED short after 4ms, and all LEDx pins shut off.

If AFC is not used, then VBIAS can be set to a fixed voltage. VBIAS must exceed the maximum VLEDx by at least 0.4V.

LED Current Setting

The LED currents of all channels are set by an external resistor at the ISET pin, which can be calculated with Equation (1):

$$I_{LED}(mA) = \frac{600}{R_{ISET}(k\Omega)} \quad (1)$$

The nominal ISET voltage (V_{ISET}) is 0.6V. When the ISET current (I_{ISET}) exceeds a specific value,

it is detected as a pin short to ground. The I_{ISET} threshold for short detection is 1mA (corresponding to a 0.6kΩ resistor, or a 1000mA I_{LED}). When I_{ISET} is below 5μA (corresponding to a 120kΩ resistor or 5mA I_{LED}), an ISET open condition is detected.

If an open or short condition is detected, the device latches off and asserts the /FS pin.

EMI Reduction

The MPQ7228 features three EMI reduction methods. The first method requires configuring the I_{LED} rising/falling slew rates during pulse-width modulation (PWM) dimming, as this can sufficiently optimize EMI performance. The I_{LED} rising/falling slew rates are controlled via register 0x01, bits[13:12]. The slew rates can be set to no slew rate, 5μs, 10μs, or 20μs. The default value is 5μs.

The second method requires configuring the I_{LED} phase-shift function. This function is controlled via register 0x01, bits[11:10]. When the phase-shift function is enabled, the channel x + 1 (where x = 1, 2...13) I_{LED} phase shift is 1μs, 5μs, or 20μs after channel x's I_{LED} rising edge.

The third EMI reduction method is frequency spread spectrum (FSS). FSS reduces EMI noise around the internal clock frequency and its harmonic frequencies. This method deliberately spreads the frequency of the clock waveform and widens the bandwidth of the switching waveform, which ultimately reduces its EMI spectral density. FSS modulates the internal clock frequency within ±10% from the central frequency, with a 15.6 kHz modulation frequency (f_M) (see Figure 7). FSS can be disabled via register 0x01, bit [0].

Figure 7: Frequency Spread Spectrum

Pulse-Width Modulation (PWM) Dimming

During pulse-width modulation (PWM) dimming, I_{LED} is chopped. This means that the I_{LED} amplitude stays the same, while the I_{LED} duty cycle varies with the PWM dimming register.

The PWM dimming duty cycle is set via the PWM dimming registers 0x07~0x26, bits[11:0].

The duty cycle (D) can be estimated with Equation (2):

$$D = \frac{PWMx}{2^{12} - 1} = \frac{PWMx}{4095} \quad (2)$$

Where PWMx is the PWM dimming register for channel x (x = 1, 2...16).

When PWMx, bits[11:0] = 0x000, the corresponding LED channel current is 0A. The PWM dimming frequency can be set via register 0x01, bits[9:8]. The dimming frequency can be set to 250Hz, 500Hz, or 1kHz.

The PWM dimming frequency and PWM dimming duty cycle can be changed on the fly.

Automatic Logarithmic Dimming

To reduce the burden on the communication bus, the MPQ7228 provides imbedded, automatic logarithmic dimming based on a fixed 64-point look-up table. Assume there are a total of 64 steps between when the duty cycle = 1% and the duty cycle = 100%. For a fixed constant ($k = 1.075$), the logarithmic curve can be fixed, so the duty cycle value for the 64 points can be calculated via software and solidified in a digital circuit. The duty cycle for Duty x is equal to ($k \times \text{Duty}(x - 1)$), where $k = 1.075$ and the initial duty cycle is 1%.

Figure 8 shows the logarithmic dimming curve.

Figure 8: Logarithmic Dimming Curve

If the configurable duty cycle is not equal to the duty cycle on the curve, one more step is required to change the configured duty cycle.

The automatic logarithmic dimming speed can be set via register 0x02, bits[10:8]. The speed

can be set to 4, 8, 16, 32, or 64 points, with a default of 16 points.

Figure 9 shows an example of the logarithmic dimming curve when the duty cycle changes. In this example, the duty cycle follows the sequence below:

- The duty cycle is configured from 0% to 80%
- The duty cycle is reduced to 30%
- The duty cycle is increased to 60%
- The duty cycle is decreased to 15%
- The duty cycle is increased to 50%

Figure 9: Logarithmic Dimming Curve with Continuous Duty Cycle Changes

Analog Dimming

During analog dimming, the I_{LED} amplitude changes when the analog dimming register changes. Change the value of the analog dimming register for the corresponding channel via 0x17~0x26, bits[5:0]. The initial value of the analog dimming register is 0x20, though it can be set from 0x00 to 0x3F. When the register increases by 1 bit, the I_{LED} amplitude increases by 0.5%. When the register decreases by 1 bit, the I_{LED} amplitude decreases by 0.5%. I_{LED} can be adjusted between 84% and 115.5% of the normal value.

Global Dimming Function

When the global dimming function is disabled, the MPQ7228 can execute both analog dimming and PWM dimming for each channel independently. When global dimming is enabled, the dimming duty cycle and amplitude for each channel follows channel 1. This means that it is possible to adjust I_{LED} for each channel by only adjusting channel 1.

Phase Shift

The MPQ7228 can set the channel-by-channel current phase shift function. This function is enabled via register 0x01, bits[13:12]. When the phase shift function is enabled, the channel $x + 1$ ($x = 1, 2...13$) I_{LED} phase shift is $1\mu s$, $5\mu s$, or $20\mu s$ after channel x 's I_{LED} rising edge.

Diagnostic and Fault Indications

The MPQ7228 supports a variety of diagnostic features, including the following:

- LED short protection
- LED open protection
- ISET pin open/short
- Thermal warning and shutdown

The /FS pin is an active-low open drain that is pulled high to an external voltage source via a $100k\Omega$ resistor. If a protection is triggered, the corresponding fault bit in the register is set.

The LATCH_EN bit determines the channel behavior and pin behavior. Fault channels should latch off or enter hiccup mode if LED open or short protection occurs (not including V_{CC} UVLO, ISET pin open/short protection, thermal warning, or thermal shutdown). The integrated failsafe flag register indicates which channel triggered the protection; if any channel triggers a protection, the related register bit is set to 1.

If LATCH_EN = 1 (latch-off mode) and the fault is triggered, the fault channel stays off until POR or until EN turns off to reset the channel. Meanwhile, the other channels operate normally. Since the fault register is R1C (the register is cleared after being read once), the fault is not flagged again — even if the fault is present — unless VCC or EN is reset.

If LATCH_EN = 0 (hiccup mode), the fault channel tries to conduct $32\mu s$ within every 1ms to detect whether the fault is cleared. /FS is released once the fault condition is removed. The fault bit remains until it is read-cleared by the MCU. It is not affected by LATCH_EN. The fault is not flagged again — even if the fault is present — unless VCC, EN, or EN_BIT is reset.

V_{CC} Under-Voltage Lockout (UVLO)

Under-voltage lockout (UVLO) protects the chip from operating at an insufficient supply voltage.

V_{CC} UVLO does not trigger the /FS pin. If V_{CC} UVLO is triggered, the IC stops working, and all the registers are reset.

LED Open Protection

The MPQ7228 features integrated LED open diagnostics. If V_{LEDx} drops below V_{LED_O} (about 100mV) for longer than 4ms, an open load condition is detected. If there is an open load on one of the outputs, the output turns off and the corresponding open fault bit (CHx_OPEN, where $x = 1, 2...16$) is set, and /FS pulls low.

If LATCH_EN = 1 (latch-off mode), the fault channel stays off until POR or until EN turns off to reset the channel. Meanwhile, the other channels operate normally. /FS is released high after the fault bit is read-cleared by the MCU.

If LATCH_EN = 0 (hiccup mode), the LED open is not latched, and the fault channel tries to conduct for $32\mu s$ within every 1ms to detect whether the fault is cleared. As soon as the open load condition is no longer present, the channel turns on again. /FS releases high once the fault condition is removed. The fault bit remains set until it is read-cleared by the MCU. It is not affected by LATCH_EN.

LED Short Protection

During an LED short, $V_{BIAS} - V_{LEDx}$ drops low. If V_{LEDx} exceeds V_{LED_S} for 4ms, LED short protection is triggered. The shorted channel turns off, the corresponding fault bit (CHx_SHORT) is set, and /FS pulls low.

If LATCH_EN = 1 (latch-off mode), the fault channel stays off until VCC or EN go low to reset the channel. Meanwhile, the other channels operate normally. /FS is released high after the fault bit is read-cleared by the MCU.

If LATCH_EN = 0 (hiccup mode), the LED short is not latched, and the fault channel tries to conduct for $32\mu s$ within every 1ms to detect whether the fault has cleared. As soon as the short load condition is removed, the channel turns on again. /FS releases high once the fault condition is removed. The fault bit remains set until it is read-cleared by the MCU. It is not affected by LATCH_EN.

The LED short protection threshold can be configured via LED_SHORT_THR, bits[1:0]. There are four potential thresholds:

- If LED_SHORT_THR = 00, the threshold is 2V.
- If LED_SHORT_THR = 01, the threshold is 3V.
- If LED_SHORT_THR = 10, the threshold is 4V.
- If LED_SHORT_THR = 11, the threshold is 5V.

ISET Pin Open/Short Protection

The MPQ7228 implements a current monitor for the ISET resistor to provide open and short diagnostics and protection. The device monitors the current (I_{SET}) flowing out of the ISET pin. If I_{SET} exceeds I_{SET_STH} (1mA), a short condition asserts. If I_{SET} falls below I_{SET_OTH} (5 μ A), an ISET pin open condition asserts.

ISET open or short protection is a latch-off protection. If an open or short is detected, the ISET_PIN_OPEN or ISET_PIN_SHORT bit is set. The MPQ7228 latches off and asserts /FS.

The fault bit can be cleared by the MCU, POR, or an EN reset. However, the /FS pin does not release high until POR or until EN goes high.

Thermal Warning

If the temperature exceeds 150°C, the OT_WARN bit is set and /FS asserts. The MPQ7228 continues working. /FS releases high once the thermal warning condition is removed. The fault bit is set until it is cleared by the MCU, POR, or an EN reset.

Thermal warning can be individually masked via OT_WARN_MASK to prevent the /FS open-drain output from pulling low. Even if the fault is masked, the fault status can still be flagged by the registers.

Thermal Shutdown

Thermal shutdown prevents the chip from operating at exceedingly high temperatures. If the die temperature exceeds 170°C, all output channels turn off, the OT_STD bit is set, and /FS

asserts. /FS releases high when the MPQ7228 recovers from thermal shutdown. The fault bit is set until it is cleared by the MCU, POR, or an EN reset.

Thermal protection is a non-latch protection. If the temperature drops at least 20°C below the thermal shutdown threshold, the MPQ7228 recovers, and the channels turn on using the previous settings without re-initializing.

Communication Protocol

The MPQ7228 uses an UART-based protocol supported by most microcontroller units (MCU), and the TX high level voltage should be higher than 2V and low level voltage should be lower than 0.7V; each frame contains multiple bytes started with a synchronization byte. The synchronization byte allows LED drivers to synchronize with master MCU frequency, therefore saving the extra cost on high precision oscillators that commonly used in UART interfaces. The UART interface can support communication frequency ranging from 150 kHz to 2MHz.

The protocol supports master-slave with star-connected topology. The UART interface supports both write and read back CMD. Table 3 describes the frame structure of a typical single-byte write action. When the MCU writes data to the MPQ7228, the MPQ7228 RX receives data with a synchronization (SYNC) byte, DEV_ADDR, REG_ADDR, DATA, and CRC (see Figure 11 on page 31). Once the MPQ7228 verifies the CRC, it sends back a status byte and a CRC byte from TX to the MCU. The register is 16 bits long. The 8LSB are transferred first, then the 8MSB are transferred. Table 4 on page 31 shows the frame structure of a typical read action. The master write frame consists of SYNC, DEV_ADDR, REG_ADDR, DATA, and CRC bytes. Once the MPQ7228 verifies the CRC, the MPQ7228 immediately feeds back a status byte and a CRC byte to the MCU via TX. Note that the CRC calculation does not include the SYNC bits.

Figure 11: Read Command with Status Feedback

Synchronization Byte

The first byte transmitted from the MCU to the MPQ7228 is the following byte: 01010101 (see Table 5). The MCU sends the clock signal to the MPQ7228 by outputting a 01010101 binary code in the first frame. The slave adaptively uses the

same clock to communicate with the MCU through the same internal, high-frequency clock. To avoid clock drift over time, the synchronization byte is always required for each new instruction transaction. This approach improves communication reliability and saves the cost of an external crystal oscillator.

Table 5: Synchronization Bytes

D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	0	1	0	1

Figure 12 shows the timing diagram for synchronization frame and device address frame.

Figure 12: Synchronization Byte

Device Address Byte

The device address byte follows the synchronization byte (see Table 6).

Table 6: Device Address Byte

Bits	Bit Name	Description
D[7:4]	DEV_ADDR	Sets the device address.
D3	BROADCAST	Sets the broadcast mode. 1: Broadcast mode 0: Single-device only. Broadcast only accepts write commands
D[2:0]	CMD	Sets the command mode. Since the register is 2 bytes, it can only support >2 bytes. 000: Write 1 byte of data 001: Write 2 bytes of data 010: Write 4 bytes of data 011: Write 8 bytes of data 100: Read 1 byte of data 101: Read 2 bytes of data 110: Read 4 bytes of data 111: Read 8 bytes of data

Register Address Byte

As a read or write start address, the REG_ADDR frame follows the device address frame. There are total of 8 bits of binary code in the register address byte (see Table 7). The register value can range between 0x00 to 0x33, with a 16-bit width.

Table 7: Register Address Byte

Bits	Bit Name	Description
D[7:0]	REG_ADDR Register address	Sets the REG_ADDR register address.

Data Byte

For the data bytes, the data frame follows the register address byte. The MPQ7228 supports single-data byte or multiple-data byte writing in a one-time data transaction. The number of data bytes is defined in the device address byte (see Table 5). There is a total of four options, including 2, 4, or 8 data bytes.

Status Byte

If no LED short or open condition is detected, D5 and D4 are set to 0. D3 is set to 1 to indicate that /FS is high (see Table 8).

Table 8: Status Byte

D7	D6	D5	D4	D3	D2	D1	D0
1	0	CH_SHORT	CH_OPEN	FS_PIN_STATUS	0	0	0

CRC Byte

The CRC code algorithm for multiple bytes of binary data is based on the polynomial $x^8 + x^5 + x^4 + 1$. The CRC code contains a binary code of 8 bits, and the initial value is 0xFF. The polynomial value is 0x31, and the XOR value is 0x00. Note that the CRC calculation does not include the SYNC bits.

Notes:

10) Commands in white that are not RESERVED or SIL_REV are read-only.

11) Commands in gray can be OTP read and written.

REGISTER DESCRIPTION

SIL_REV (0x00)

POR: Load from the OTP.

The SIL_REV command provides readout data and returns the silicon information.

Bits	Access	Bit Name	Default	Description
D[15:8]	RSV	RESERVED	0x00	Reserved. Always reads as 0.
D[7:4]	RSV	RESERVED	0x0	Reserved. Always reads as 0.
D[3:0]	R	SIL_REV	0x1	Returns the silicon revision information.

DEV_CFG_1 (0x01)

POR: Load from the OTP.

The DEV_CFG_1 command configures the LED short threshold, PWM dimming frequency, LED current (I_{LED}) slew rate, and phase shift during PWM dimming. It also enables global dimming and the frequency spread spectrum (FSS) function.

Bits	Access	Bit Name	Default	Description
D[15:14]	R/W	LED_SHORT_TH	00	Sets the LED short threshold. 00: 2V 01: 3V 10: 4V 11: 5V
D[13:12]	R/W	SLEW_RATE	00	Controls the dimming slew rate. 00: No slew rate 01: 5 μ s 10: 10 μ s 11: 20 μ s
D[11:10]	R/W	PHASE_SHIFT	00	Controls the PWM dimming phase shift. 00: No phase shift between channels 01: The rising edge of channel x + 1 is 1 μ s after channel x 10: The rising edge of channel x + 1 is 5 μ s after channel x 11: The rising edge of channel x + 1 is 20 μ s after channel x
D[9:8]	R/W	PWM_FREQ	10	Sets the LED channel PWM dimming frequency. The PWM frequency can be changed on the fly. 00: 1kHz 01: 500Hz 10: 250Hz 11: 1kHz
D[7:2]	RSV	RESERVED	0	Reserved.
D1	R/W	GLOBAL_DIM	0	When global dimming is enabled, all channels share dimming settings with channel 1. This allows users to adjust I_{LED} of all channels by only changing channel 1. 0: Disable global dimming 1: Enable global dimming
D0	R/W	FSS_EN	0	Enables frequency spread spectrum (FSS). 0: Disabled 1: Enabled

DEV_CFG_2 (0x02)

POR: Load from the OTP.

The DEV_CFG_2 command configures the LED open/short fault mask and protection behavior, the thermal warning fault mask, automatic dimming parameters, logarithmic automatic dimming, AFC, and the analog dimming circuit.

Bits	Access	Bit Name	Default	Description
D15	R/W	CH_FS_MASK	0	Enables the /FS mask for LED channel diagnostics. 0: Disabled. /FS pulls down if there is a fault error flag or any channel experiences a short/open 1: Enabled. /FS does not pull down if there is a fault error flag or any channel experiences a short/open
D14	R/W	LATCH_EN	1	Sets the fault protection mode. If a fault is detected on a channel, the related channel latches off or enters hiccup mode while the other channels work normally. 0: Hiccup mode 1: Latch-off mode
D13	RSV	CRC_EN	1	Reserved.
D12	R/W	AUTO_DIM_MODE	0	Sets the logarithmic automatic dimming mode. 0: Manual mode. The PWM dimming duty cycle changes for the next PWM dimming cycle 1: Automatic dimming mode (logarithmic dimming). The duty cycle changes according to the fixed exponential curve with a certain speed setting
D11	R/W	AUTO_DIM_HOLD	0	0: Normal operation. The dimming duty cycles changes to the setting value 1: Stop all the ongoing automatic dimming ramping, and remain at the current dimming value on the curve
D[10:8]	R/W	AUTO_DIM_SPEED	000	Sets the automatic dimming speed for the 64-point logarithmic curve. 000: Normal speed. Jump 4 points per PWM cycle (0% to 100% in 16 PWM cycles) 001: 2x speed. Jump 8 points per PWM cycle (0% to 100% in 8 PWM cycles) 010: 4x speed. Jump 16 points per PWM cycle (0% to 100% in 4 PWM cycles) 011: 1/2x speed. Jump 2 points per PWM cycle (0% to 100% in 32 PWM cycles) 100: 1/4x speed, jump 1 points per PWM cycle (0% to 100% in 64 PWM cycles) Others: Reserved, or similar to selecting 000
D7	R/W	OT_WARN_FS_MASK	0	Sets the over-temperature (OT) warning diagnostic mask control. 0: An OT warning signal pulls down the /FS pin 1: An OT warning signal does not pull down the /FS pin
D[6:2]	RSV	RESERVED	0	Reserved.
D1	R/W	MOD_EN	1	Enables adaptive feedback control (AFC). 0: AFC is disabled. Disable up-down counter and maintain the current modulation bit 1: AFC is enabled. Enable the up-down counter
D0	R/W	EN_ANA	1	Enables the analog circuit. 0: The analog circuit is disabled. When disabled, the device shuts down 1: The analog circuit is enabled. When enabled, the device turns on

CH_EN (0x03)

POR: Load from the OTP.

The CH_EN command enables channels 1–16.

Bits	Access	Bit Name	Default	Description
D[15:0]	R/W	CHx_EN	0xFFFF	Channel enable bit. Bits[15:0] control channel 16 to channel 1, respectively. If any channel is not used, set the related bit to 0. 0: Disabled 1: Enabled

DIAG_STAT_1 (0x04)

POR: N/A

The DIAG_STAT_1 command reports the channel LEDx open statuses. If any bit is set to 1, this means the related channel is open. If the register is read one time, the open flag resets to 0.

Bits	Access	Bit Name	Default	Description
D[15:0]	R1C	CHx_OPEN	0x0000	Channel x open protection fault flag. Bits[15:0] control channel 16 to channel 1, respectively. If any channel is not used, set the related bit to 0. 0: No open fault was detected 1: An open fault was detected. After being read, /FS is reset with the fault flag if the mode is set to latch-off mode; if the mode is set to hiccup mode, the fault flag is reset even if the fault is still present, but /FS resets after the fault is removed

DIAG_STAT_2 (0x05)

POR: N/A

The DIAG_STAT_2 command reports the channel LEDx short statuses. If the bit is set to 1, the related channel is experiencing a short condition. If the register is read one time, the open flag resets to 0.

Bits	Access	Bit Name	Default	Description
D[15:0]	R1C	CHx_SHORT	0x0000	Channel x short protection fault flag. Bits[15:0] control channel 16 to channel 1, respectively. If any channel is not used, set the related bit to 0. 0: No short fault was detected 1: A short fault was detected. After being read, /FS is reset along with the fault flag if the mode is set to latch-off mode; if the mode is set to hiccup mode, the fault flag is reset even if the fault is still present, but /FS resets after the fault is removed

DIAG_STAT_3 (0x06)

POR: N/A

The DIAG_STAT_3 command reports an OT warning, ISET pin short/open fault, and thermal shutdown status. If a bit is set to 1, the related protection is triggered; when the register is read one time, the related flag resets to 0.

Bits	Access	Bit Name	Default	Description
D15	RSV	RESERVED	0	Reserved.
D14	R1C	OT_WARN	0	OT warning status. 0: No OT warning is present 1: There is an OT warning. After being read, the fault flag is reset. When the temperature recovers, /FS returns to high

D13	R1C	ISET_PIN_SHORT	0	ISET pin short flag. 0: No short condition was detected on the ISET pin 1: A short condition was detected on the ISET pin. After being read, the fault flag is reset. Only VCC or EN can reset the /FS pin
D12	R1C	ISET_PIN_OPEN	0	ISET pin open flag. 0: No open condition was detected on the ISET pin 1: An open condition was detected on the ISET pin. After being read, the fault flag is reset. Only VCC or EN can reset the /FS pin
D11	RSV	RESERVED	0	Reserved.
D10	R1C	OT_SD	0	Returns the OT shutdown status. 0: No OT shutdown has occurred 1: OT shutdown has occurred. After being read, the fault flag is reset. When the temperature recovers, /FS pulls high
D[9:0]	RSV	RESERVED	0	Reserved.

CHx_PWM (0x07~0x16)

POR: Load from the OTP.

The CHx_DIM command controls the PWM dimming duty cycle for all channels (channels 1–16). Register 0x07 corresponds to channel 1, while register 0x16 corresponds with channel 16.

Bits	Access	Bit Name	Default	Description
D[15:12]	RSV	RESERVED	0	Reserved.
D[11:0]	R/W	PWM_DIM	0xFFF	Sets PWM dimming for the corresponding channel.

CHx_ANA_DIM (0x17~0x26)

POR: Load from the OTP.

The CHx_ANA_DIM command controls the analog dimming range for all channels (channels 1–16). Register 0x17 corresponds to channel 1, while register 0x26 corresponds with channel 16.

Bits	Access	Bit Name	Default	Description
D[15:6]	RSV	RESERVED	0	Reserved.
D[5:0]	R/W	ANA_DIM	0x20	Sets analog dimming for the corresponding channel. The register value can be set from 0x00 to 0x3F.

VBIAS_VOLT (0x27)

POR: Load from the OTP.

The VBIAS_VOLT command sets the pre- V_{BIAS} voltage. It can only be changed via the OTP.

Bits	Access	Bit Name	Default	Description																		
D[15:8]	R	PRE-VBIAS	0x54	Sets the pre- V_{BIAS} voltage. When the register value increases by 1, V_{BIAS} increases by 0.05V, and the FBO voltage = 1.2V.																		
				<table><tr><th>V_{BIAS} (V)</th><th>Bits[15:8] (Dec)</th><th>Bits[15:8] (Hex)</th></tr><tr><td>2.5</td><td>14</td><td>0E</td></tr><tr><td>2.55</td><td>15</td><td>0F</td></tr><tr><td>...</td><td>...</td><td>...</td></tr><tr><td>13.95</td><td>243</td><td>F3</td></tr><tr><td>14</td><td>244</td><td>F4</td></tr></table>	V_{BIAS} (V)	Bits[15:8] (Dec)	Bits[15:8] (Hex)	2.5	14	0E	2.55	15	0F	...	...	...	13.95	243	F3	14	244	F4

				2.55	15	0F																
				...	...	...																
				13.95	243	F3																
14	244	F4																				
D[7:0]	R	REAL_VBIAS	0xxx	The real value of the V_{BIAS} counter. Automatically adjusted after the MPQ7228 starts up.																		

DROP_BAND (0x28)

Default: 0x25B9

POR: Load from the OTP.

The DROP_BAND command controls the LED voltage (V_{LEDx}) for the AFC band, including the low band and the high band. It can only be changed via the OTP.

Bits	Access	Bit Name	Default	Description																				
D[15:8]	RSV	RESERVED	0x25	Reserved.																				
D[7:5]	R	LOW_BAND	0b101	Sets the low-band value for AFC.																				
				<table><tr><th>Bits[7:5]</th><th>Low-Band Value</th><th>Bits[7:5]</th><th>Low-Band Value</th></tr><tr><td>000</td><td>0.2V</td><td>100</td><td>0.4</td></tr><tr><td>001</td><td>0.25V</td><td>101</td><td>0.45</td></tr><tr><td>010</td><td>0.3V</td><td>110</td><td>0.5</td></tr><tr><td>011</td><td>0.35V</td><td>111</td><td>0.55</td></tr></table>	Bits[7:5]	Low-Band Value	Bits[7:5]	Low-Band Value	000	0.2V	100	0.4	001	0.25V	101	0.45	010	0.3V	110	0.5	011	0.35V	111	0.55

D[1:0]	RSV	RESERVED	0b01	Reserved.																				

SUFFIX_CODE (0x32)

POR: Load from the OTP.

The SUFFIX_CODE command returns the code information. It can only be changed via the OTP.

Bits	Access	Bit Name	Default	Description
D[15:8]	RSV	RESERVED	0x00	Reserved.
D[7:0]	R	SUFFIX_CODE	0x00	Returns the suffix code information. It can also be used to store the code information, though this can only be changed via the OTP.

SADDR_PAGE (0x33)

Default: 0x0000. Read-only after OTP.

POR: Load from the OTP

The SADDR_PAGE command controls the device address. It can only be changed via the OTP, and is read-only after OTP.

Bits	Access	Bit Name	Default	Description
D[15:7]	RSV	RESERVED	0x00	Reserved.
D6	R	SADDR_PAGE	0	Information register. Can be set to 0 or 1 via the OTP to support different device addresses.
D[5:0]	RSV	RESERVED	0x00	Reserved.

APPLICATION INFORMATION

AFC Network Connection

The FBI, FBO, and MODE pins are related to AFC. If AFC is not used, float the FBO pin, then connect FBI and MODE to GND (see Figure 13).

Figure 13: Application Circuit without AFC

V_{BIAS} can be set by the DC/DC converter's feedback voltage, which can be calculated with Equation (3):

$$V_{BIAS} = V_{FB} \left(1 + \frac{R1}{R2}\right) \quad (3)$$

Consider the maximum V_{LEDx} and ensure that $(V_{BIAS} - V_{LEDx})$ exceeds the headroom of each V_{LEDx} .

When using AFC, connect the FBI pin of the last slave device or single chip to GND; otherwise, connect FBI to the FBO pin of the next MPQ7228 for the current sink headroom information (see Figure 14).

Figure 14: Application Circuit with AFC and a Connected FBO

For example, slave 2's FBI pin should be connected to slave 3's FBO pin. For the master device, the FBO pin is the feedback output, and it should be connected to the DC/DC converter's feedback pin via a resistor divider network.

If the MPQ7228 and DC/DC converter are on the same board, or if there is a connected FBO wire condition, the resistor network can be connected according to Figure 18 on page 43. Then the feedback resistors ($R1$ and $R2$) can be estimated with Equation (4):

$$V_{FBO} = V_{FB} \left(1 + \frac{R1}{R2}\right) \quad (4)$$

Where V_{FB} is the reference voltage of the DC/DC converter (e.g. for the MPQ4323C, it is 0.8V),

and V_{FBO} is between 0.6V and 2.2V. If $V_{FBO} = 1.2V$ and $R2 = 80.6k\Omega$, then $R1 = 40.2k\Omega$.

The pre- V_{BIAS} voltage is set via the OTP, internal modulator, and resistors ($R1$ and $R2$) (see Figure 15).

Figure 15: AFC Modulator Network

N can be adjusted between 14 and 244 via the OTP register 0x27 (see Figure 19 on page 44). Note that the pre- V_{BIAS} voltage should match V_{LEDx} , or the device detects an LED open or short when the LED is on. If $V_{FBO} = 1.2V$ and $N = 100$ (0x6464), then the pre- V_{BIAS} voltage should be set to 6.8V.

N automatically adjusts when V_{LEDx} changes after the device starts operating. If $V_{FB} = 0.8V$, then $R2 = 80.6k\Omega$, and $R1 = 40.2k\Omega$, V_{FBO} is about 1.2V, and V_{BIAS} can be adjusted between 2.5V and 14V with an N change between 14 and 244. See the $VBIAS_VOLT$ (0x27) section on page 37 for more details.

If the MPQ7228 and DC/DC converter are not on the same PCB, there must be an FBO line between the converter and the MPQ7228. If the FBO line is open, V_{BIAS} is regulated to the battery voltage (V_{BATT}), then an LED short is triggered.

A resistor network can be used to prevent V_{BIAS} from regulating to V_{BATT} when the FBO line is open.

Figure 16 shows the AFC modulator network.

Figure 16: AFC Modulator Network

V_{BIAS} can be calculated with Equation (5):

$$V_{BIAS} = \frac{V_{FB} \times (R1 + R3) + \frac{V_{FB}}{R2} \times R1 \times R3}{\frac{240}{R1 \times \frac{N+12}{240} + R3} + R3} \quad (5)$$

When $R3$ is disconnected, V_{BIAS_O} can be estimated with Equation (6):

$$V_{BIAS_O} = V_{FB} \times \left(1 + \frac{R1}{R2}\right) \quad (6)$$

Figure 17 shows the AFC network with FBO open protection.

Figure 17: AFC Modulator Network with FBO Open Protection

For example, when the MPQ7228 has 2 LEDs in series ($V_{LEDx} = 6.3V$), set $V_{BIAS_O} = 7.1V$ when FBO is open. If the DC/DC converter's V_{FB} is 0.8V, set $R1 = 100k\Omega$ so that $R2 = 12.7k\Omega$. If N is set to 100 via the OTP, set $R3 = 100k\Omega$. Then the pre- V_{BIAS} voltage is 6.71V. When N changes from 14 to 244, V_{BIAS} changes from 5.9V to 7.6V, so consider the pre- V_{BIAS} voltage setting via the OTP, as well as the resistor selection when making this connection. The connection in Figure 16 on page 39 minimizes the V_{BIAS} range.

Selecting the VBIAS Capacitor

The VBIAS pin is the bias supply. The MPQ7228 operates from an input voltage (V_{IN}) between 2.5V and 18V. A capacitor (C_{IN}) is required to decouple the VBIAS line's voltage noise. If using the MPQ4323 output as V_{BIAS} for the MPQ7228, a decoupling capacitor is required for the MPQ7228's VBIAS (2 x 22 μ F, 2 x 10 μ F, and 0.1 μ F). Place the 22 μ F capacitors close to the DC/DC converter (e.g. the MPQ4323C). Place the 10 μ F capacitors close the LEDs, and place the 0.1 μ F capacitor close to the MPQ7228's VBIAS pin.

Selecting the VCC Capacitor and Current Capability

The VCC pin is the internal bias power supply. An internal LDO from VBIAS generates the 3.3V V_{CC} . VCC supplies power to the internal control circuitry and gate drivers. A $\geq 10\mu$ F decoupling capacitor and 10k Ω resistor should be placed from VCC to ground. A 10k Ω resistor makes the V_{CC} always close 0 each time IC turns on. VCC needs power from the external LDO if the V_{BIAS} cannot sufficiently power VCC. The external LDO should be between 3.1V and 3.5V, with a 20mA current ability. When there are multiple devices in parallel, the external DC source current capability should be ($n \times 20mA$), where n is the number of devices.

LED Current Setting

Set the I_{LED} of all channels using an external resistor at the ISET pin. I_{LED} can be calculated with Equation (7):

$$I_{SET}(mA) = \frac{600}{R_{ISET}(k\Omega)} \quad (7)$$

Certain ISET resistors are recommended (see Table 9).

Table 9: Resistor Selection

I_{LED} (mA)	R_{ISET} (k Ω)
200	3.01
100	6.04
50	12.1

I_{LED} can be adjusted via analog dimming and PWM dimming. For more details, see the Pulse-Width Modulation (PWM) Dimming section on page 27 and the Analog Dimming section on page 28.

MODE Pin Configuration

If AFC is disabled, connect the MODE pin to GND. If AFC is enabled and the part is the master, connect MODE to GND; if it is a slave device, connect MODE to VCC.

Enable (EN) Pin

If the EN pin is not used to control the MPQ7228's on/off function, EN can be directly connected to VBIAS using a 10k Ω resistor. When EN pulls low, VCC shuts down, and all the registers are reset.

ADDR1 and ADDR2 Pin

The ADDR1 and ADDR2 pins set the device address. They must be connected to VCC and GND, or connected to GND through a 35k Ω resistor (within a $\pm 10\%$ range).

TX/RX Pin

Since the MCU is located in a separate board, the CAN physical layer must be used for off-board long distance communication between the LED driver boards and the MCU board. The RX and TX interface pull-up resistors may be required, depending on the CAN transceiver model. The recommended RX and TX pull-up resistance for most applications is about 2k Ω . Note that the MPQ7228 RX and TX pins only support up to 4V max. It is recommended to use a CAN transceiver, which the VIO pin allows for direct interfacing with 3.3V.

Electrostatic Discharge (ESD) Protection Design

Electrostatic discharge (ESD) is the release of static electricity when two objects come into contact. If any pin of the MPQ7228 needs to connect to another board through a connector line, it may suffer the ESD. Typically, the LEDx pin and FBO pin have a chance to connect with other boards through a line. For the LEDx pin, it is recommended that a $\leq 100\text{nF}$ capacitor is placed in parallel with V_{LEDx} to reduce ESD if the LED load and the MPQ7228 are not on the same board.

PCB Layout Guidelines for BCI/EMC

Efficient PCB layout is critical for stable operation. Consider the bulk current injection (BCI), as FBO has a maximum current capability of 5mA for anti-interference. To improve BCI and EMC results, and for the best results, refer to Figure 18 on page 43 and follow the guidelines below:

1. For the DC/DC converter (e.g. the MPQ4323C), place the symmetric input capacitors as close to VIN and GND as possible.
2. For the MPQ4323C, ensure that the high-current paths at GND and VIN have short, direct, and wide traces.
3. For the MPQ4323C, place the VCC capacitor as close to VCC and GND as possible.
4. For the MPQ4323C, route SW and BST away from sensitive analog areas, such as FB.
5. For the MPQ7228, place the feedback resistors close to the chip to ensure that the trace connected to FB is as short as possible.
6. For the MPQ7228, place the capacitors as close to the input as possible.
7. For the MPQ7228, add a small capacitor as close to the IC pins as possible to improve anti-interference abilities.
8. For the MPQ7228, a GND polygon is required to improve anti-interference abilities and heat dissipation.
9. For the MPQ7228, make the GND polygon large.

2-Layer Layout Guidelines

For a 2-layer PCB layout, follow the steps below:

1. The top layer should include the power, signal, and GND.
2. Cover GND in all areas except for the signal and power path.
3. The bottom layer should only include the GND polygon to shield noise interference, unless there is not enough PCB space.

4-Layer Layout Guidelines

For a 4-layer PCB layout, follow the steps below:

1. The top layer should include the power, signal, and GND.
2. Cover GND in all areas on the top layer except for the signal and power path.
3. The second layer should only include GND to shield noise interference on the top layer.
4. The third layer should include the power, signal, and GND.
5. Cover GND in all areas on the third layer except for the signal path.
6. Cover GND in all areas on the bottom layer except for the signal and power path.

SECTION A-A

RECOMMENDED LAND PATTERN

NOTE:

- 1) THE LEAD SIDE IS WETTABLE.
- 2) ALL DIMENSIONS ARE IN MILLIMETERS.
- 3) EXPOSED PADDLE SIZE DOES NOT INCLUDE MOLD FLASH.
- 4) LEAD COPLANARITY SHALL BE 0.08 MILLIMETERS MAX.
- 5) JEDEC REFERENCE IS MO-220.
- 6) DRAWING IS NOT TO SCALE.

CARRIER INFORMATION

Part Number	Package Description	Quantity/ Reel	Quantity/ Tube	Quantity/ Tray	Reel Diameter	Carrier Tape Width	Carrier Tape Pitch
MPQ7228GQJE-xxxx-AEC1-Z	QFN-32 (5mmx6mm)	5000	N/A	N/A	13in	12mm	8mm
