

IGLOO 2 FPGA and SmartFusion 2 SoC FPGA

INTRODUCTION

This datasheet covers the electrical AC and DC specifications for five temperature grades of devices (part number prefixes M2GL005, M2GL010, M2GL025, M2GL050, M2GL060, M2GL090, M2GL150) and four temperature grades of devices (part number prefixes M2S005, M2S010, M2S025, M2S050, M2S060, M2S090 and M2S150). AC and DC electrical characteristics and parametric values, unless otherwise noted, apply to all the temperature grade devices. Users are expected to close timing using SmartTime for the speed and temperate grade of the device chosen.

Microchip's mainstream SmartFusion[®] 2 SoC and IGLOO[®] 2 FPGA families integrate an industry standard 4-input LookUp Table (LUT)-based FPGA fabric with integrated math blocks, multiple embedded memory blocks, and high-performance SerDes communication interfaces on a single chip. Both families benefit from low-power flash technology and are the most secure and reliable FPGAs in the industry. These next generation devices offer up to 150K Logic Elements, up to 5 MBs of embedded RAM, up to 16 SerDes lanes, up to four PCI Express Gen 2 endpoints, and integrated hard DDR3 memory controllers with error correction.

SmartFusion 2 devices integrate an entire low-power, real-time Microcontroller Subsystem (MSS) with a rich set of industry-standard peripherals including Ethernet, USB, and CAN, while IGLOO 2 devices integrate a high-performance memory subsystem with on-chip flash, 32 KB embedded SRAM, and multiple DMA controllers.

2 This product is designed and validated for operation within the junction temperature (T_J) range specified in the Recommended Operating Conditions in this datasheet. Device functionality and performance outside this recommended operating range are not supported. Customers should account for the temperature difference between ambient (T_A) and junction (T_J) in their thermal environment and specific use case, which may result in a different and typically narrower ambient (T_A) operating temperature range.

3 Programming at Industrial temperature range is available only with V_{PP} = 3.3V.

Note: All power supply ramps must be strictly monotonic, without plateaus.

5: The SmartFusion® 2 and IGLOO® 2 FPGA Retention Calculator is on [Secure Document Extranet \(SDE\)](#) portal.

6: The purpose of the the SmartFusion® 2 and IGLOO® 2 retention lifetime calculator is to allow the user to model their system's total life cycle; from storage to deployment to operation. Applies to both biased/powered and unbiased/unpowered conditions.

7: Retention lifetime is the total time the device sees over the life of the product starting from the device Date Code onwards, including time spent in storage, or deployed.

3.1.1 OVERSHOOT/UNDERSHOOT LIMITS

For AC signals, the input signal may undershoot during transitions to -1.0V for no longer than 10% of the period. The current during the transition must not exceed 100 mA.

For AC signals, the input signal may overshoot during transitions to $V_{CC1} + 1.0\text{V}$ for no longer than 10% of the period.

The current during the transition must not exceed 100 mA.

Note: The preceding specifications do not apply to the PCI standard. The IGLOO 2 and SmartFusion 2 PCI I/Os are compliant with the PCI standard including the PCI overshoot/undershoot specifications.

3.1.2 THERMAL CHARACTERISTICS

The temperature variable in the Microchip SoC Products Group Designer software refers to the junction temperature, not the ambient, case, or board temperatures. This is an important distinction because dynamic and static power consumption causes the chip's junction temperature to be higher than the ambient, case, or board temperatures.

EQ1 through EQ3 give the relationship between thermal resistance, temperature gradient, and power.

EQ1

$$\theta_{JA} = \frac{T_J - T_A}{P}$$

EQ2

$$\theta_{JB} = \frac{T_J - T_B}{P}$$

EQ3

$$\theta_{JC} = \frac{T_J - T_C}{P}$$

where:

|---------------|---|--|
| θ_{JA} | = | Junction-to-air thermal resistance |
| θ_{JB} | = | Junction-to-board thermal resistance |
| θ_{JC} | = | Junction-to-case thermal resistance |
| T_J | = | Junction temperature |
| T_A | = | Ambient temperature |
| T_B | = | Board temperature (measured 1.0 mm away from the package edge) |
| T_C | = | Case temperature |
| P | = | Total power dissipated by the device |

3.1.2.1 Theta-JA

Junction-to-ambient thermal resistance (θ_{JA}) is determined under standard conditions specified by JEDEC (JESD-51), but it has little relevance in the actual performance of the product. It must be used with caution, but it is useful for comparing the thermal performance of one package with another.

The maximum power dissipation allowed is calculated using EQ4.

EQ4

$$\text{Maximum power allowed} = \frac{T_{J(\text{MAX})} - T_{A(\text{MAX})}}{\theta_{JA}}$$

The absolute maximum junction temperature is 100 °C. EQ5 shows a sample calculation of the absolute maximum power dissipation allowed for the M2GL050T-FG896 package at commercial temperature and in still air, where:

Table 1-1 •

θ_{JA} = 14.7 °C/W (taken from [Table 3-7](#)).

T_A = 85 °C

EQ5

$$\text{Maximum power allowed} = \frac{100\text{ °C} - 85\text{ °C}}{14.7\text{ °C/W}} = 1.088\text{ W}$$

The power consumption of a device can be calculated using the Microchip SoC Products Group power calculator. The device's power consumption must be lower than the calculated maximum power dissipation by the package.

If the power consumption is higher than the device's maximum allowable power dissipation, a heat sink may be attached to the top of the case, or the airflow inside the system must be increased.

3.1.2.2 Theta-JB

Junction-to-board thermal resistance (θ_{JB}) measures the ability of the package to dissipate heat from the surface of the chip to the PCB. As defined by the JEDEC (JESD-51) standard, the thermal resistance from the junction to the board uses an isothermal ring cold plate zone concept. The ring cold plate is simply a means to generate an isothermal boundary condition at the perimeter. The cold plate is mounted on a JEDEC standard board with a minimum distance of 5.0 mm away from the package edge.

3.1.2.3 Theta-JC

Junction-to-case thermal resistance (θ_{JC}) measures the ability of a device to dissipate heat from the surface of the chip to the top or bottom surface of the package. It is applicable to packages used with external heat sinks. Constant temperature is applied to the surface, which acts as a boundary condition.

This only applies to situations where all or nearly all the heat is dissipated through the surface in consideration.

These differential versions of the standard require a differential amplifier input buffer and a push-pull output buffer.

3.6.2 STUB-SERIES TERMINATED LOGIC

Stub-Series Terminated Logic (SSTL) for 2.5V (SSTL2), 1.8V (SSTL18), and 1.5V (SSTL15) is supported in IGLOO 2 and SmartFusion 2 SoC FPGAs. SSTL2 is defined by JEDEC standard JESD8-9B and SSTL18 is defined by JEDEC standard JESD8-15. IGLOO 2 SSTL I/O configurations are designed to meet double data rate standards DDR/2/3 for general purpose memory buses. Double data rate standards are designed to meet their JEDEC specifications as defined by JEDEC standard JESD79F for DDR, JEDEC standard JESD79-2F for DDR, JEDEC standard JESD79-3D for DDR3, and JEDEC standard JESD209A for LPDDR.

3.6.3 STUB-SERIES TERMINATED LOGIC 2.5V (SSTL2)

SSTL2 Class I and Class II are supported in IGLOO 2 and SmartFusion 2 SoC FPGAs and also comply with reduced and full drive of double data rate (DDR) standards. IGLOO 2 and SmartFusion 2 SoC FPGA I/Os supports both standards for single-ended signaling and differential signaling for SSTL2. This standard requires a differential amplifier input buffer and a push-pull output buffer.

3.7 Differential I/O Standards

Configuration of the I/O modules as a differential pair is handled by Microchip FPGA Products Group Libero software when the user instantiates a differential I/O macro in the design. Differential I/Os can also be used in conjunction with the embedded Input Register (InReg), Output Register (OutReg), Enable Register (EnReg), and Double Data Rate (DDR) registers.

3.7.1 LVDS

Low-Voltage Differential Signaling (ANSI/TIA/EIA-644) is a high-speed, differential I/O standard.

1 when V_{ID} is < 300 mV, the input signal is delayed by up to an additional 450 ps for LVDS25 and 280 ps for LVDS33. This delay is not accounted in the timing model. Clock insertion delays, propagation delays, and I/O to FF delays are marginally affected. Adding a parallel termination resistor of $200\Omega \pm 5\%$ across the receiver pins can mitigate this additional delay when V_{ID} is < 300 mV.

3.7.6 LVPECL

Low-Voltage Positive Emitter-Coupled Logic (LVPECL) is another differential I/O standard. It requires that one data bit be carried through two signal lines. Similar to LVDS, two pins are needed. It also requires external resistor termination. IGLOO 2 and SmartFusion 2 SoC FPGAs support only LVPECL receivers and do not support LVPECL transmitters.
