

## SN6501 Transformer Driver for Isolated Power Supplies

### 1 Features

- Push-pull driver for small transformers
- Single 3.3-V or 5-V supply
- High primary-side current drive:
  - 5-V Supply: 350 mA (Max)
  - 3.3-V Supply: 150 mA (Max)
- Low ripple on rectified output permits small output capacitors
- Small 5-Pin SOT-23 Package

### 2 Applications

- Isolated interface power supply for CAN, RS-485, RS-422, RS-232, SPI, I2C, Low-Power LAN
- Industrial automation
- Process control
- Medical equipment

### 3 Description

The SN6501 is a monolithic oscillator/power-driver, specifically designed for small form factor, isolated power supplies in isolated interface applications. The device drives a low-profile, center-tapped transformer primary from a 3.3-V or 5-V DC power supply. The secondary can be wound to provide any isolated voltage based on transformer turns ratio.

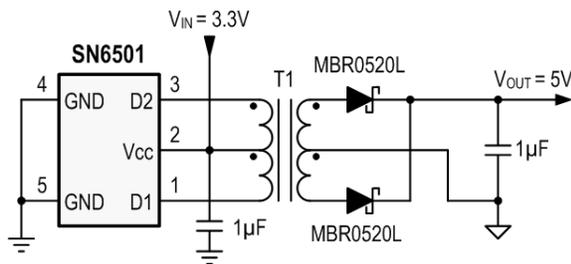

The SN6501 consists of an oscillator followed by a gate drive circuit that provides the complementary output signals to drive the ground referenced N-channel power switches. The internal logic ensures break-before-make action between the two switches.

The SN6501 is available in a small SOT-23 (5) package, and is specified for operation at temperatures from  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ .

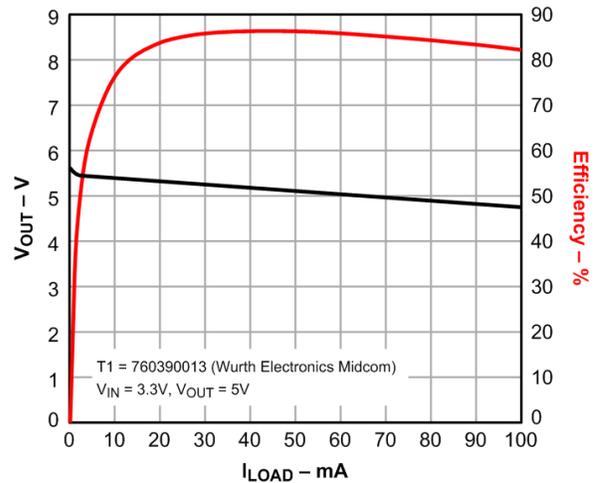

#### Device Information

PART NUMBER <sup>(1)</sup>	PACKAGE	BODY SIZE (NOM)
SN6501	SOT-23 (5)	2.90 mm x 1.60 mm

- (1) For all available packages, see the orderable addendum at the end of the datasheet.

## 4 Pin Configuration and Functions

**Figure 4-1. 5-Pin SOT-23 DBV Package Top View**

**Table 4-1. Pin Functions**

PIN			DESCRIPTION
NAME	NUMBER	TYPE	
D1	1	OD	Open Drain output 1. Connect this pin to one end of the transformer primary side.
V <sub>CC</sub>	2	P	Supply voltage input. Connect this pin to the center-tap of the transformer primary side. Buffer this voltage with a 1 $\mu$ F to 10 $\mu$ F ceramic capacitor.
D2	3	OD	Open Drain output 2. Connect this pin to the other end of the transformer primary side.
GND	4,5	P	Device ground. Connect this pin to board ground.

## 5 Specifications

### 5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
V <sub>CC</sub>	Supply voltage	-0.3	6	V
V <sub>D1</sub> , V <sub>D2</sub>	Output switch voltage		14	V
I <sub>D1P</sub> , I <sub>D2P</sub>	Peak output switch current		500	mA
P <sub>TOT</sub>	Continuous power dissipation		250	mW
T <sub>J</sub>	Junction temperature		170	°C

- (1) Stresses beyond those listed under Absolute Maximum Ratings cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under [Section 5.3](#) is not implied. Exposure to absolute-maximum-rated conditions for extended periods affects device reliability.

### 5.2 Handling Ratings

			MIN	MAX	UNIT
T <sub>stg</sub>	Storage temperature range		-65	150	°C
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	-4	4	kV
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	-1.5	1.5	
		Machine Model JEDEC JESD22-A115-A	-200	200	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 5.3 Recommended Operating Conditions

			MIN	TYP	MAX	UNIT
V <sub>CC</sub>	Supply voltage		3		5.5	V
V <sub>D1</sub> , V <sub>D2</sub>	Output switch voltage	V <sub>CC</sub> = 5 V ± 10%,	0		11	V
		V <sub>CC</sub> = 3.3 V ± 10%	0		7.2	
I <sub>D1</sub> , I <sub>D2</sub>	D1 and D2 output switch current – Primary-side	V <sub>CC</sub> = 5 V ± 10%			350	mA
		V <sub>CC</sub> = 3.3 V ± 10%			150	
T <sub>A</sub>	Ambient temperature		–40		125	°C

### 5.4 Thermal Information

THERMAL METRIC		SN6501	UNIT
		DBV 5-PINS	
θ <sub>JA</sub>	Junction-to-ambient thermal resistance	208.3	°C/W
θ <sub>JCtop</sub>	Junction-to-case (top) thermal resistance	87.1	
θ <sub>JB</sub>	Junction-to-board thermal resistance	40.4	
ψ <sub>JT</sub>	Junction-to-top characterization parameter	5.2	
ψ <sub>JB</sub>	Junction-to-board characterization parameter	39.7	
θ <sub>JCbot</sub>	Junction-to-case (bottom) thermal resistance	N/A	

### 5.5 Electrical Characteristics

over full-range of recommended operating conditions, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
R <sub>ON</sub>	Switch-on resistance	V <sub>CC</sub> = 3.3 V ± 10%, See <a href="#">Figure 6-4</a>		1	3	Ω
		V <sub>CC</sub> = 5 V ± 10%, See <a href="#">Figure 6-4</a>		0.6	2	
I <sub>CC</sub>	Average supply current <sup>(1)</sup>	V <sub>CC</sub> = 3.3 V ± 10%, no load		150	400	μA
		V <sub>CC</sub> = 5 V ± 10%, no load		300	700	
f <sub>ST</sub>	Startup frequency	V <sub>CC</sub> = 2.4 V, See <a href="#">Figure 6-4</a>		300		kHz
f <sub>SW</sub>	D1, D2 Switching frequency	V <sub>CC</sub> = 3.3 V ± 10%, See <a href="#">Figure 6-4</a>	250	360	550	kHz
		V <sub>CC</sub> = 5 V ± 10%, See <a href="#">Figure 6-4</a>	300	410	620	

(1) Average supply current is the current used by SN6501 only. It does not include load current.

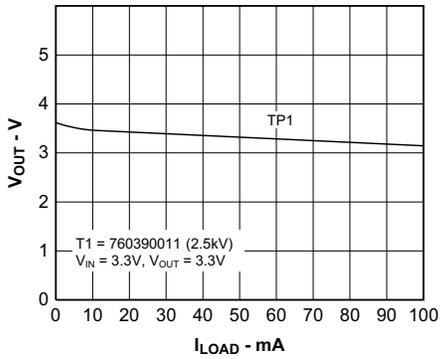

### 5.6 Switching Characteristics

over operating free-air temperature range (unless otherwise noted)

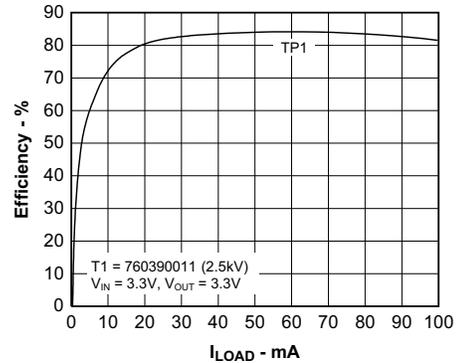

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t <sub>r-D</sub>	D1, D2 output rise time	V <sub>CC</sub> = 3.3 V ± 10%, See <a href="#">Figure 6-4</a>		70		ns
		V <sub>CC</sub> = 5 V ± 10%, See <a href="#">Figure 6-4</a>		80		
t <sub>f-D</sub>	D1, D2 output fall time	V <sub>CC</sub> = 3.3 V ± 10%, See <a href="#">Figure 6-4</a>		110		ns
		V <sub>CC</sub> = 5 V ± 10%, See <a href="#">Figure 6-4</a>		60		
t <sub>BBM</sub>	Break-before-make time	V <sub>CC</sub> = 3.3 V ± 10%, See <a href="#">Figure 6-4</a>		150		ns
		V <sub>CC</sub> = 5 V ± 10%, See <a href="#">Figure 6-4</a>		50		

### 5.7 Typical Characteristics

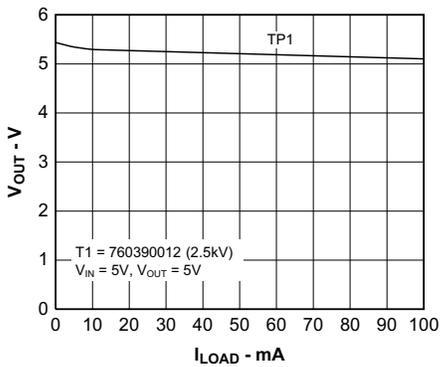

TP1 Curves are measured with the Circuit in [Figure 6-1](#); whereas, TP1 and TP2 Curves are measured with Circuit in [Figure 6-3](#) ( $T_A = 25^\circ\text{C}$  unless otherwise noted). See [Table 8-3](#) for Transformer Specifications.

## 7 Detailed Description

### 7.1 Overview

The SN6501 is a transformer driver designed for low-cost, small form-factor, isolated DC-DC converters utilizing the push-pull topology. The device includes an oscillator that feeds a gate-drive circuit. The gate-drive, comprising a frequency divider and a break-before-make (BBM) logic, provides two complementary output signals which alternately turn the two output transistors on and off.

The output frequency of the oscillator is divided down by an asynchronous divider that provides two complementary output signals with a 50% duty cycle. A subsequent break-before-make logic inserts a dead-time between the high-pulses of the two signals. The resulting output signals, present the gate-drive signals for the output transistors. As shown in the functional block diagram, before either one of the gates can assume logic high, there must be a short time period during which both signals are low and both transistors are high-impedance. This short period, known as break-before-make time, is required to avoid shorting out both ends of the primary.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 Push-Pull Converter

Push-pull converters require transformers with center-taps to transfer power from the primary to the secondary (see Figure 7-1).

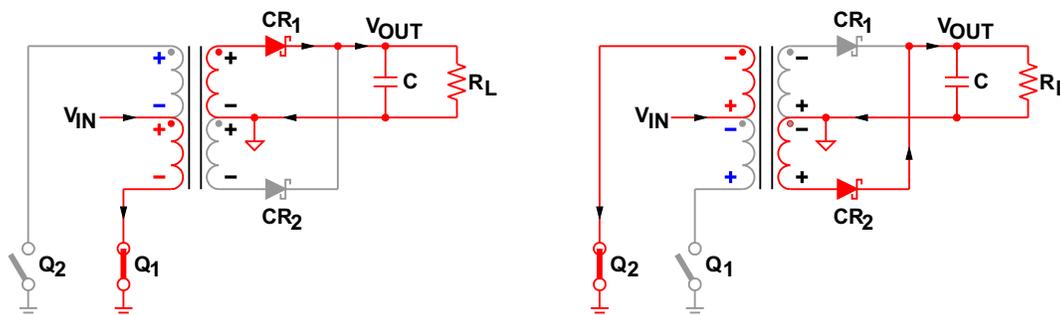

Figure 7-1. Switching Cycles of a Push-Pull Converter

When  $Q_1$  conducts,  $V_{IN}$  drives a current through the lower half of the primary to ground, thus creating a negative voltage potential at the lower primary end with regards to the  $V_{IN}$  potential at the center-tap.

At the same time the voltage across the upper half of the primary is such that the upper primary end is positive with regards to the center-tap in order to maintain the previously established current flow through  $Q_2$ , which now has turned high-impedance. The two voltage sources, each of which equaling  $V_{IN}$ , appear in series and cause a voltage potential at the open end of the primary of  $2 \times V_{IN}$  with regards to ground.

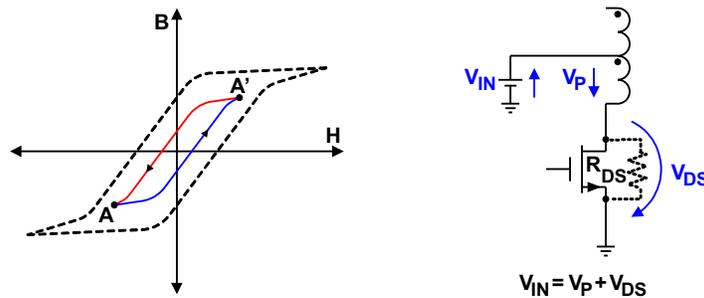

Per dot convention the same voltage polarities that occur at the primary also occur at the secondary. The positive potential of the upper secondary end therefore forward biases diode  $CR_1$ . The secondary current

starting from the upper secondary end flows through CR<sub>1</sub>, charges capacitor C, and returns through the load impedance R<sub>L</sub> back to the center-tap.

When Q<sub>2</sub> conducts, Q<sub>1</sub> goes high-impedance and the voltage polarities at the primary and secondary reverse. Now the lower end of the primary presents the open end with a 2×V<sub>IN</sub> potential against ground. In this case CR<sub>2</sub> is forward biased while CR<sub>1</sub> is reverse biased and current flows from the lower secondary end through CR<sub>2</sub>, charging the capacitor and returning through the load to the center-tap.

### 7.3.2 Core Magnetization

Figure 7-2 shows the ideal magnetizing curve for a push-pull converter with B as the magnetic flux density and H as the magnetic field strength. When Q<sub>1</sub> conducts the magnetic flux is pushed from A to A', and when Q<sub>2</sub> conducts the flux is pulled back from A' to A. The difference in flux and thus in flux density is proportional to the product of the primary voltage, V<sub>P</sub>, and the time, t<sub>ON</sub>, it is applied to the primary:  $B \approx V_P \times t_{ON}$ .

**Figure 7-2. Core Magnetization and Self-Regulation Through Positive Temperature Coefficient of R<sub>DS(on)</sub>**

This volt-seconds (V-t) product is important as it determines the core magnetization during each switching cycle. If the V-t products of both phases are not identical, an imbalance in flux density swing results with an offset from the origin of the B-H curve. If balance is not restored, the offset increases with each following cycle and the transformer slowly creeps toward the saturation region.

Fortunately, due to the positive temperature coefficient of a MOSFET's on-resistance, the output FETs of the SN6501 have a self-correcting effect on V-t imbalance. In the case of a slightly longer on-time, the prolonged current flow through a FET gradually heats the transistor which leads to an increase in R<sub>DS-on</sub>. The higher resistance then causes the drain-source voltage, V<sub>DS</sub>, to rise. Because the voltage at the primary is the difference between the constant input voltage, V<sub>IN</sub>, and the voltage drop across the MOSFET,  $V_P = V_{IN} - V_{DS}$ , V<sub>P</sub> is gradually reduced and V-t balance restored.

## 7.4 Device Functional Modes

The functional modes of the SN6501 are divided into start-up, operating, and off-mode.

### 7.4.1 Start-Up Mode

When the supply voltage at V<sub>CC</sub> ramps up to 2.4 V typical, the internal oscillator starts operating at a start frequency of 300 kHz. The output stage begins switching but the amplitude of the drain signals at D1 and D2 has not reached its full maximum yet.

### 7.4.2 Operating Mode

When the device supply has reached its nominal value ±10% the oscillator is fully operating. However variations over supply voltage and operating temperature can vary the switching frequencies at D1 and D2 between 250 kHz and 550 kHz for V<sub>CC</sub> = 3.3 V ±10%, and between 300 kHz and 620 kHz for V<sub>CC</sub> = 5 V ±10%.

### 7.4.3 Off-Mode

The SN6501 is deactivated by reducing V<sub>CC</sub> to 0 V. In this state both drain outputs, D1 and D2, are high-impedance.

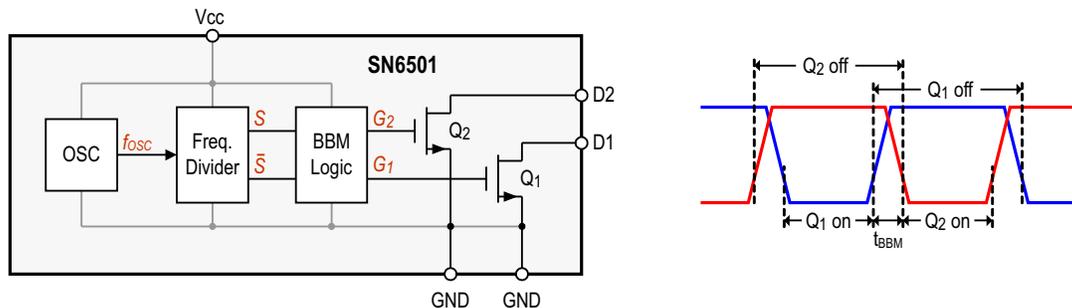

## 8 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

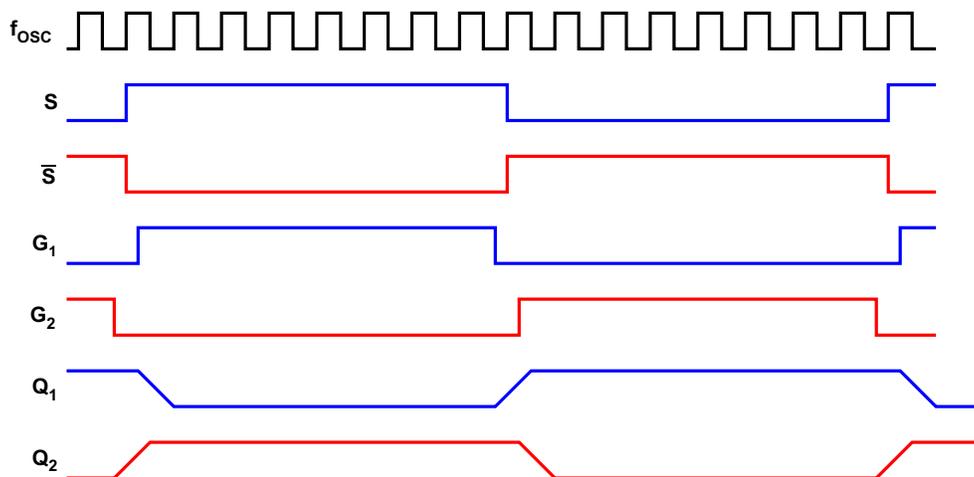

### 8.1 Application Information

The SN6501 is a transformer driver designed for low-cost, small form-factor, isolated DC-DC converters utilizing the push-pull topology. The device includes an oscillator that feeds a gate-drive circuit. The gate-drive, comprising a frequency divider and a break-before-make (BBM) logic, provides two complementary output signals which alternately turn the two output transistors on and off.

**Figure 8-1. SN6501 Block Diagram And Output Timing With Break-Before-Make Action**

The output frequency of the oscillator is divided down by an asynchronous divider that provides two complementary output signals,  $S$  and  $\bar{S}$ , with a 50% duty cycle. A subsequent break-before-make logic inserts a dead-time between the high-pulses of the two signals. The resulting output signals,  $G_1$  and  $G_2$ , present the gate-drive signals for the output transistors  $Q_1$  and  $Q_2$ . As shown in Figure 8-2, before either one of the gates can assume logic high, there must be a short time period during which both signals are low and both transistors are high-impedance. This short period, known as break-before-make time, is required to avoid shorting out both ends of the primary.

**Figure 8-2. Detailed Output Signal Waveforms**

## 8.2 Typical Application

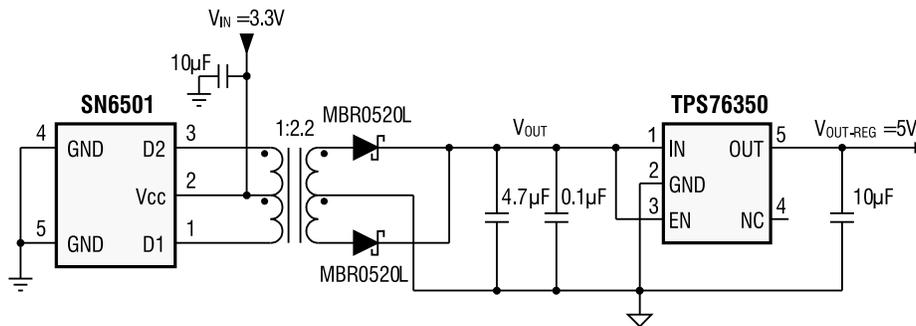

Figure 8-3. Typical Application Schematic (SN6501)

### 8.2.1 Design Requirements

For this design example, use the parameters listed in [Table 8-1](#) as design parameters.

Table 8-1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage range	3.3 V $\pm$ 3%
Output voltage	5 V
Maximum load current	100 mA

### 8.2.2 Detailed Design Procedure

The following recommendations on components selection focus on the design of an efficient push-pull converter with high current drive capability. Contrary to popular belief, the output voltage of the unregulated converter output drops significantly over a wide range in load current. The characteristic curve in [Figure 5-11](#) for example shows that the difference between  $V_{OUT}$  at minimum load and  $V_{OUT}$  at maximum load exceeds a transceiver's supply range. Therefore, in order to provide a stable, load independent supply while maintaining maximum possible efficiency the implementation of a low dropout regulator (LDO) is strongly advised.

The final converter circuit is shown in [Figure 8-7](#). The measured  $V_{OUT}$  and efficiency characteristics for the regulated and unregulated outputs are shown in [Figure 5-1](#) to [Figure 5-28](#).

#### 8.2.2.1 SN6501 Drive Capability

The SN6501 transformer driver is designed for low-power push-pull converters with input and output voltages in the range of 3 V to 5.5 V. While converter designs with higher output voltages are possible, care must be taken that higher turns ratios don't lead to primary currents that exceed the SN6501 specified current limits.

Unlike [SN6505](#) devices, SN6501 does not have soft-start, internal current limit, or thermal shutdown (TSD) features. Therefore to address possible unregulated or large currents, there is a limit to the maximum capacitive load that can be connected to an SN6501 system. Loads exceeding 5 $\mu$ F appear as short circuits to SN6501 during power up and may affect the device's long-term reliability. When using SN6501, it is recommended to keep capacitive loads below 5 $\mu$ F or incorporate LDOs with low short-circuit current limits or soft-start features to ensure excessive current is not drawn from SN6501.

#### 8.2.2.2 LDO Selection

The minimum requirements for a suitable low dropout regulator are:

- Its current drive capability should slightly exceed the specified load current of the application to prevent the LDO from dropping out of regulation. Therefore for a load current of 100 mA, choose a 100 mA to 150 mA LDO. While regulators with higher drive capabilities are acceptable, they also usually possess higher dropout voltages that will reduce overall converter efficiency.
- The internal dropout voltage,  $V_{DO}$ , at the specified load current should be as low as possible to maintain efficiency. For a low-cost 150 mA LDO, a  $V_{DO}$  of 150 mV at 100 mA is common. Be aware however, that this

lower value is usually specified at room temperature and can increase by a factor of 2 over temperature, which in turn will raise the required minimum input voltage.

- The required minimum input voltage preventing the regulator from dropping out of line regulation is given with:

$$V_{I-\min} = V_{DO-\max} + V_{O-\max} \tag{1}$$

This means in order to determine  $V_I$  for worst-case condition, the user must take the maximum values for  $V_{DO}$  and  $V_O$  specified in the LDO data sheet for rated output current (i.e., 100 mA) and add them together. Also specify that the output voltage of the push-pull rectifier at the specified load current is equal or higher than  $V_{I-\min}$ . If it is not, the LDO will lose line-regulation and any variations at the input will pass straight through to the output. Hence below  $V_{I-\min}$  the output voltage will follow the input and the regulator behaves like a simple conductor.

- The maximum regulator input voltage must be higher than the rectifier output under no-load. Under this condition there is no secondary current reflected back to the primary, thus making the voltage drop across  $R_{DS-on}$  negligible and allowing the entire converter input voltage to drop across the primary. At this point the secondary reaches its maximum voltage of

$$V_{S-\max} = V_{IN-\max} \times n \tag{2}$$

with  $V_{IN-\max}$  as the maximum converter input voltage and  $n$  as the transformer turns ratio. Thus to prevent the LDO from damage the maximum regulator input voltage must be higher than  $V_{S-\max}$ . [Table 8-2](#) lists the maximum secondary voltages for various turns ratios commonly applied in push-pull converters with 100 mA output drive.

**Table 8-2. Required Maximum LDO Input Voltages for Various Push-Pull Configurations**

PUSH-PULL CONVERTER				LDO
CONFIGURATION	$V_{IN-\max}$ [V]	TURNS-RATIO	$V_{S-\max}$ [V]	$V_{I-\max}$ [V]
3.3 $V_{IN}$ to 3.3 $V_{OUT}$	3.6	1.5 ± 3%	5.6	6 to 10
3.3 $V_{IN}$ to 5 $V_{OUT}$	3.6	2.2 ± 3%	8.2	10
5 $V_{IN}$ to 5 $V_{OUT}$	5.5	1.5 ± 3%	8.5	10

### 8.2.2.3 Diode Selection

A rectifier diode should always possess low-forward voltage to provide as much voltage to the converter output as possible. When used in high-frequency switching applications, such as the SN6501 however, the diode must also possess a short recovery time. Schottky diodes meet both requirements and are therefore strongly recommended in push-pull converter designs. A good choice for low-volt applications and ambient temperatures of up to 85°C is the low-cost Schottky rectifier MBR0520L with a typical forward voltage of 275 mV at 100-mA forward current. For higher output voltages such as ±10 V and above use the MBR0530 which provides a higher DC blocking voltage of 30 V.

Lab measurements have shown that at temperatures higher than 100°C the leakage currents of the above Schottky diodes increase significantly. This can cause thermal runaway leading to the collapse of the rectifier output voltage. Therefore, for ambient temperatures higher than 85°C use low-leakage Schottky diodes, such as RB168M-40.

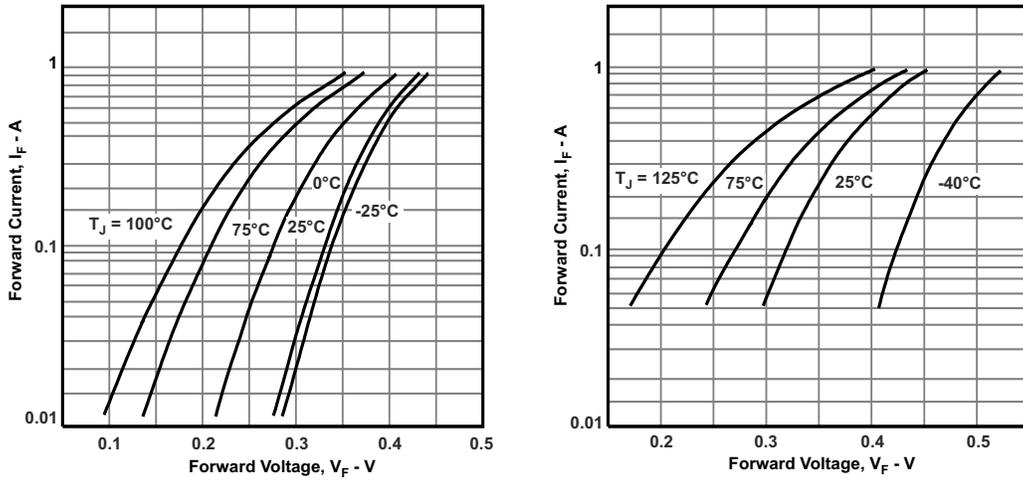

Figure 8-4. Diode Forward Characteristics for MBR0520L (Left) and MBR0530 (Right)

### 8.2.2.4 Capacitor Selection

The capacitors in the converter circuit in [Figure 8-7](#) are multi-layer ceramic chip (MLCC) capacitors.

As with all high speed CMOS ICs, the SN6501 requires a bypass capacitor in the range of 10 nF to 100 nF.

The input bulk capacitor at the center-tap of the primary supports large currents into the primary during the fast switching transients. For minimum ripple make this capacitor 1 μF to 10 μF. In a 2-layer PCB design with a dedicated ground plane, place this capacitor close to the primary center-tap to minimize trace inductance. In a 4-layer board design with low-inductance reference planes for ground and  $V_{IN}$ , the capacitor can be placed at the supply entrance of the board. To ensure low-inductance paths use two vias in parallel for each connection to a reference plane or to the primary center-tap.

The bulk capacitor at the rectifier output smoothes the output voltage. Make this capacitor 1 μF to 10 μF.

The small capacitor at the regulator input is not necessarily required. However, good analog design practice suggests, using a small value of 47 nF to 100 nF improves the regulator's transient response and noise rejection.

The LDO output capacitor buffers the regulated output for the subsequent isolator and transceiver circuitry. The choice of output capacitor depends on the LDO stability requirements specified in the data sheet. However, in most cases, a low-ESR ceramic capacitor in the range of 4.7 μF to 10 μF will satisfy these requirements.

### 8.2.2.5 Transformer Selection

#### 8.2.2.5.1 V-t Product Calculation

To prevent a transformer from saturation its V-t product must be greater than the maximum V-t product applied by the SN6501. The maximum voltage delivered by the SN6501 is the nominal converter input plus 10%. The maximum time this voltage is applied to the primary is half the period of the lowest frequency at the specified input voltage. Therefore, the transformer's minimum V-t product is determined through:

$$Vt_{\min} \geq V_{IN-\max} \times \frac{T_{\max}}{2} = \frac{V_{IN-\max}}{2 \times f_{\min}} \quad (3)$$

Inserting the numeric values from the data sheet into the equation above yields the minimum V-t products of

$$Vt_{\min} \geq \frac{3.6 \text{ V}}{2 \times 250 \text{ kHz}} = 7.2 \text{ V}\mu\text{s} \quad \text{for 3.3 V, and}$$

$$Vt_{\min} \geq \frac{5.5 \text{ V}}{2 \times 300 \text{ kHz}} = 9.1 \text{ V}\mu\text{s} \quad \text{for 5 V applications.} \quad (4)$$

Common V-t values for low-power center-tapped transformers range from 22 Vμs to 150 Vμs with typical footprints of 10 mm x 12 mm. However, transformers specifically designed for PCMCIA applications provide as little as 11 Vμs and come with a significantly reduced footprint of 6 mm x 6 mm only.

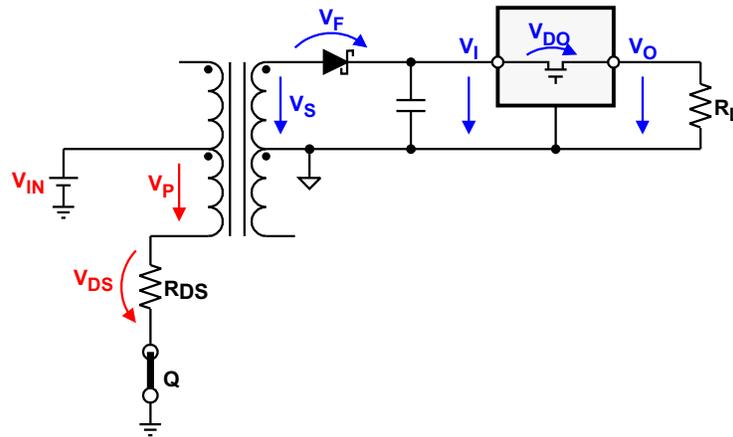

While Vt-wise all of these transformers can be driven by the SN6501, other important factors such as isolation voltage, transformer wattage, and turns ratio must be considered before making the final decision.

#### 8.2.2.5.2 Turns Ratio Estimate

Assume the rectifier diodes and linear regulator has been selected. Also, it has been determined that the transformer chosen must have a V-t product of at least 11 Vμs. However, before searching the manufacturer websites for a suitable transformer, the user still needs to know its minimum turns ratio that allows the push-pull converter to operate flawlessly over the specified current and temperature range. This minimum transformation ratio is expressed through the ratio of minimum secondary to minimum primary voltage multiplied by a correction factor that takes the transformer's typical efficiency of 97% into account:

$V_{S-\min}$  must be large enough to allow for a maximum voltage drop,  $V_{F-\max}$ , across the rectifier diode and still provide sufficient input voltage for the regulator to remain in regulation. From the LDO SELECTION section, this minimum input voltage is known and by adding  $V_{F-\max}$  gives the minimum secondary voltage with:

$$V_{S-\min} = V_{F-\max} + V_{DO-\max} + V_{O-\max} \quad (5)$$

**Figure 8-5. Establishing the Required Minimum Turns Ratio Through  $n_{\min} = 1.031 \times V_{S-\min} / V_{P-\min}$**

Then calculating the available minimum primary voltage,  $V_{P-\min}$ , involves subtracting the maximum possible drain-source voltage of the SN6501,  $V_{DS-\max}$ , from the minimum converter input voltage  $V_{IN-\min}$ :

$$V_{P-\min} = V_{IN-\min} - V_{DS-\max} \quad (6)$$

$V_{DS-\max}$  however, is the product of the maximum  $R_{DS(on)}$  and  $I_D$  values for a given supply specified in the SN6501 data sheet:

$$V_{DS-\max} = R_{DS-\max} \times I_{D-\max} \quad (7)$$

Then inserting Equation 7 into Equation 6 yields:

$$V_{P-\min} = V_{IN-\min} - R_{DS-\max} \times I_{D-\max} \quad (8)$$

and inserting Equation 8 and Equation 5 into Equation 9 provides the minimum turns ratio with:

$$n_{\min} = 1.031 \times \frac{V_{F-\max} + V_{DO-\max} + V_{O-\max}}{V_{IN-\min} - R_{DS-\max} \times I_{D-\max}} \quad (9)$$

### Example:

For a 3.3  $V_{IN}$  to 5  $V_{OUT}$  converter using the rectifier diode MBR0520L and the 5 V LDO TPS76350, the data sheet values taken for a load current of 100 mA and a maximum temperature of 85°C are  $V_{F-\max} = 0.2$  V,  $V_{DO-\max} = 0.2$  V, and  $V_{O-\max} = 5.175$  V.

Then assuming that the converter input voltage is taken from a 3.3 V controller supply with a maximum  $\pm 2\%$  accuracy makes  $V_{IN-\min} = 3.234$  V. Finally the maximum values for drain-source resistance and drain current at 3.3 V are taken from the SN6501 data sheet with  $R_{DS-\max} = 3$   $\Omega$  and  $I_{D-\max} = 150$  mA.

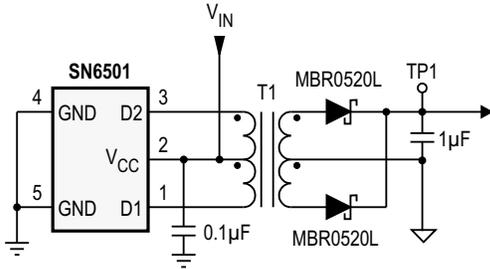

Inserting the values above into Equation 9 yields a minimum turns ratio of:

$$n_{\min} = 1.031 \times \frac{0.2\text{V} + 0.2\text{V} + 5.175\text{V}}{3.234\text{V} - 3\ \Omega \times 150\text{mA}} = 2 \quad (10)$$

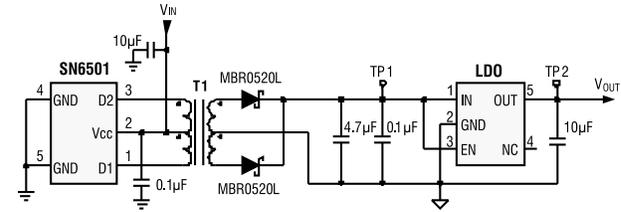

Most commercially available transformers for 3-to-5 V push-pull converters offer turns ratios between 2.0 and 2.3 with a common tolerance of  $\pm 3\%$ .

**8.2.2.5.3 Recommended Transformers**

Depending on the application, use the minimum configuration in [Figure 8-6](#) or standard configuration in [Figure 8-7](#).

**Figure 8-6. Unregulated Output for Low-Current Loads With Wide Supply Range**

**Figure 8-7. Regulated Output for Stable Supplies and High Current Loads**

The Würth Electronics Midcom isolation transformers in [Table 8-3](#) are optimized designs for the SN6501, providing high efficiency and small form factor at low-cost.

The 1:1.1 and 1:1.7 turns-ratios are designed for logic applications with wide supply rails and low load currents. These applications operate without LDO, thus achieving further cost-reduction.

**Table 8-3. Recommended Isolation Transformers Optimized for SN6501**

Turns Ratio	V x T (Vµs)	Isolation (V <sub>RMS</sub> )	Dimensions (mm)	Application	LDO	Figures	Order No.	Manufacturer

### 8.2.3 Application Curve

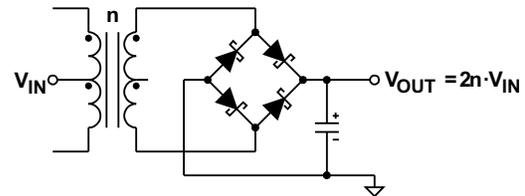

See [Table 8-3](#) for application curves.

### 8.2.4 Higher Output Voltage Designs

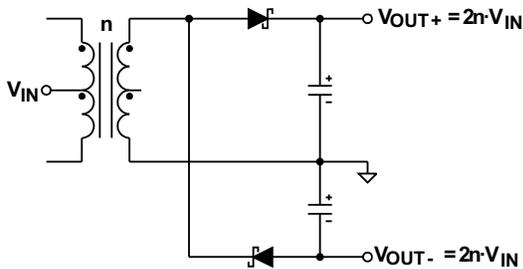

The SN6501 can drive push-pull converters that provide high output voltages of up to 30 V, or bipolar outputs of up to  $\pm 15$  V. Using commercially available center-tapped transformers, with their rather low turns ratios of 0.8 to 5, requires different rectifier topologies to achieve high output voltages. [Figure 8-8](#) to [Figure 8-11](#) show some of these topologies together with their respective open-circuit output voltages.

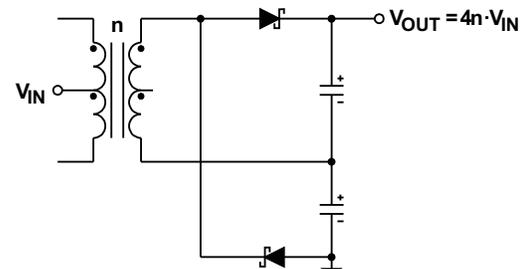

**Figure 8-8. Bridge Rectifier With Center-Tapped Secondary Enables Bipolar Outputs**

**Figure 8-9. Bridge Rectifier Without Center-Tapped Secondary Performs Voltage Doubling**

**Figure 8-10. Half-Wave Rectifier Without Center-Tapped Secondary Performs Voltage Doubling, Centered Ground Provides Bipolar Outputs**

**Figure 8-11. Half-Wave Rectifier Without Centered Ground and Center-Tapped Secondary Performs Voltage Doubling Twice, Hence Quadrupling  $V_{IN}$**

### 8.2.5 Application Circuits

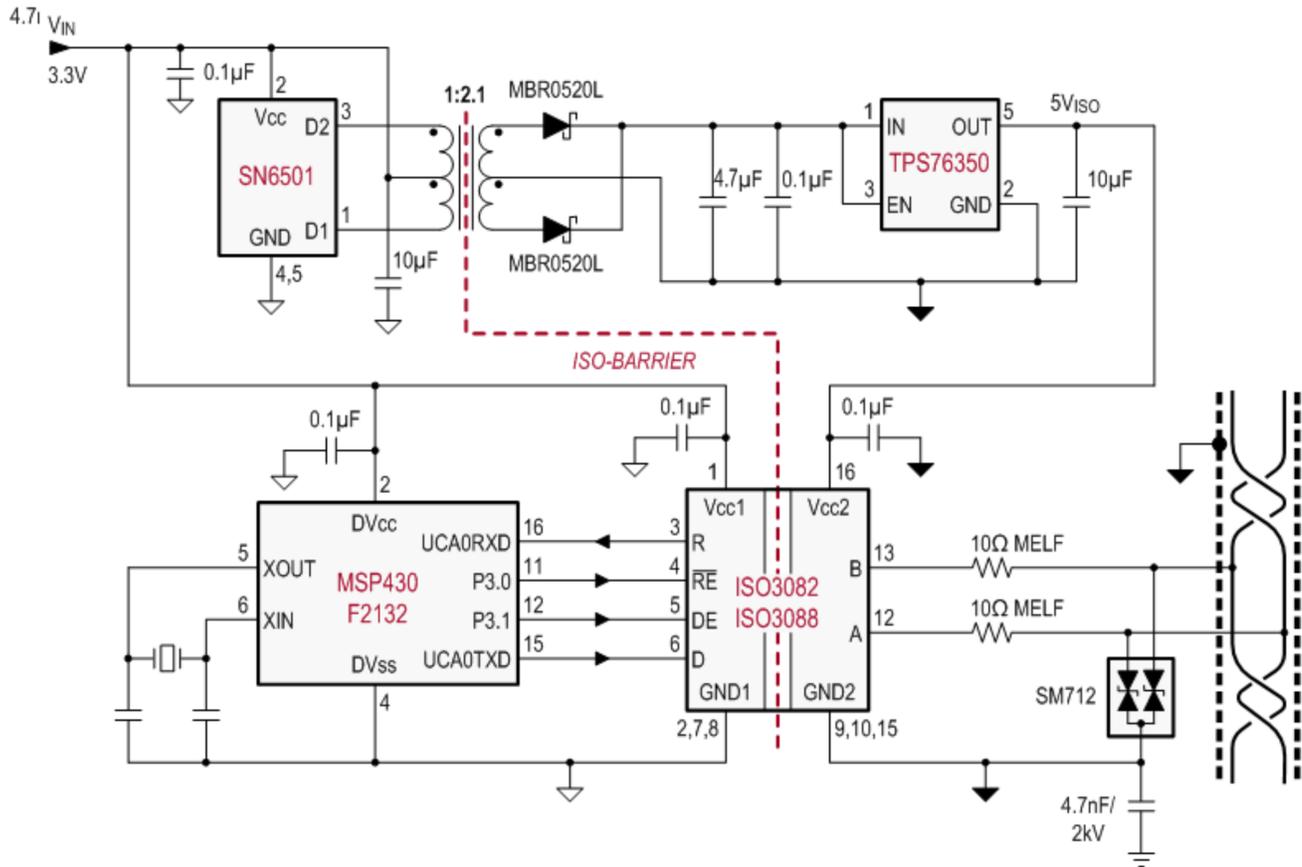

The following application circuits are shown for a 3.3 V input supply commonly taken from the local, regulated micro-controller supply. For 5 V input voltages requiring different turn ratios refer to the transformer manufacturers and their websites listed in [Table 8-4](#).

## 9 Power Supply Recommendations

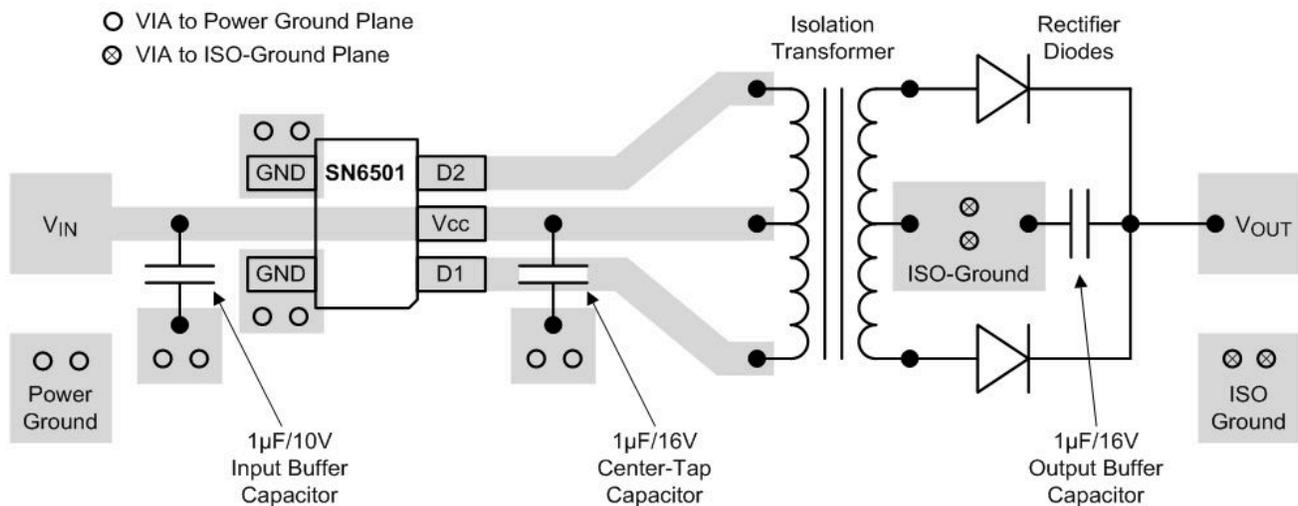

The device is designed to operate from an input voltage supply range between 3.3 V and 5 V nominal. This input supply must be regulated within  $\pm 10\%$ . If the input supply is located more than a few inches from the SN6501 a 0.1  $\mu\text{F}$  by-pass capacitor should be connected as possible to the device  $V_{CC}$  pin, and a 10  $\mu\text{F}$  capacitor should be connected close to the transformer center-tap pin.

## 10 Layout

### 10.1 Layout Guidelines

- The  $V_{IN}$  pin must be buffered to ground with a low-ESR ceramic bypass-capacitor. The recommended capacitor value can range from 1  $\mu\text{F}$  to 10  $\mu\text{F}$ . The capacitor must have a voltage rating of 10 V minimum and a X5R or X7R dielectric.
- The optimum placement is closest to the  $V_{IN}$  and GND pins at the board entrance to minimize the loop area formed by the bypass-capacitor connection, the  $V_{IN}$  terminal, and the GND pin. See [Figure 10-1](#) for a PCB layout example.
- The connections between the device D1 and D2 pins and the transformer primary endings, and the connection of the device  $V_{CC}$  pin and the transformer center-tap must be as close as possible for minimum trace inductance.
- The connection of the device  $V_{CC}$  pin and the transformer center-tap must be buffered to ground with a low-ESR ceramic bypass-capacitor. The recommended capacitor value can range from 1  $\mu\text{F}$  to 10  $\mu\text{F}$ . The capacitor must have a voltage rating of 16 V minimum and a X5R or X7R dielectric.
- The device GND pins must be tied to the PCB ground plane using two vias for minimum inductance.
- The ground connections of the capacitors and the ground plane should use two vias for minimum inductance.
- The rectifier diodes should be Schottky diodes with low forward voltage in the 10 mA to 100 mA current range to maximize efficiency.
- The  $V_{OUT}$  pin must be buffered to ISO-Ground with a low-ESR ceramic bypass-capacitor. The recommended capacitor value can range from 1  $\mu\text{F}$  to 10  $\mu\text{F}$ . The capacitor must have a voltage rating of 16 V minimum and a X5R or X7R dielectric.

## 11 Device and Documentation Support

### 11.1 Device Support

#### 11.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

### 11.2 Trademarks

All trademarks are the property of their respective owners.

### 11.3 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 11.4 Glossary

**TI Glossary** This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable part number	Status (1)	Material type (2)	Package   Pins	Package qty   Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
<a href="#">SN6501DBVR</a>	Active	Production	SOT-23 (DBV)   5	3000   LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	6501

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

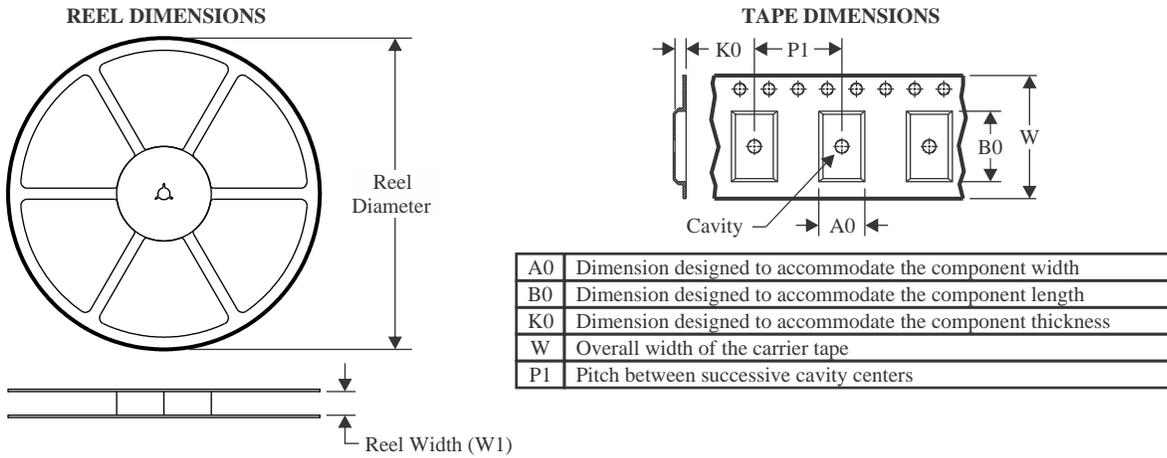

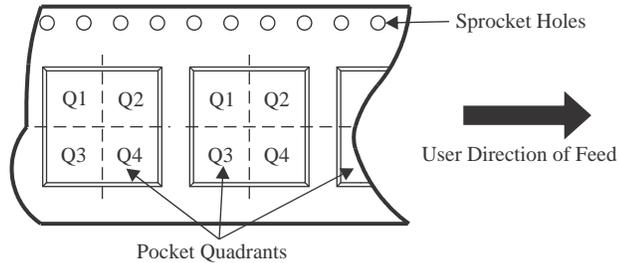

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
