

EVQ7200A-L-00A

42V, 3A, 410kHz, Synchronous LED Driver Buck Mode Evaluation Board, AEC-Q100 Qualified

DESCRIPTION

The EVQ7200A-L-00A is an evaluation board designed to demonstrate the capabilities of the MPQ7200A, a constant-current LED driver with integrated power MOSFETs. It offers a compact solution to achieve 3A of continuous output current (I_{OUT}), with excellent load and line regulation across a wide input supply range.

Constant frequency hysteretic control mode provides fast transient response without loop compensation. The switching frequency (f_{SW}) is

410kHz in buck mode for optimized efficiency and electromagnetic interference (EMI) performance.

The MPQ7200A is available in a QFN-19 (3mmx4mm) package with wettable flanks, and is available in AEC-Q100 Grade 1.

The EVQ7200A-L-00A is a fully assembled and tested buck mode LED driver evaluation board. It generates an LED current up to 3A from a 6V to 42V input range.

PERFORMANCE SUMMARY

Specifications are at $T_A = 25^\circ\text{C}$, unless otherwise noted.

Parameters	Conditions	Value
Input voltage (V_{IN}) range		6V to 42V
Maximum output current (I_{OUT})	$V_{IN} = 6\text{V to } 42\text{V}$	3A
Typical efficiency	$V_{IN} = 13.5\text{V}$, 2 LEDs, $I_{LED} = 3\text{A}$	93.32%
Peak efficiency	$V_{IN} = 8\text{V}$, 2 LEDs, $I_{LED} = 0.75\text{A}$	96.22%
Switching frequency (f_{SW})		410kHz

EVALUATION BOARD

LxWxH (8.3cmx8.3cmx1.3cm)

Board Number	MPS IC Number
EVQ7200A-L-00A	MPQ7200AGLE-AEC1

QUICK START GUIDE

1. Preset the power supply between 6V and 42V, then turn off the power supply (see Figure 1).

Figure 1: Measurement Equipment Set-Up

2. If longer cables (>0.5m total) are being used between the source and the evaluation board, install a damping capacitor at the input terminals. This is especially critical when V_{EMI} exceeds 24V.
3. Connect the power supply terminals to:
 - a. Positive (+): VEMI
 - b. Negative (-): GND
4. Connect the load terminals to:
 - a. Positive (+): VLED+
 - b. Negative (-): VLED-
5. After making the connections, turn on the power supply.
6. To use the enable (EN) function, apply a digital input to the EN/DIM pin. Drive EN above 2.5V to turn the regulator on; drive EN below 1V to turn it off.
7. When two-step dimming is inactive ($R_{DUTY} = 4.87k\Omega$), an external 100Hz to 2kHz pulse-width modulation (PWM) waveform can be applied to the EN/DIM pin.
8. To initiate the two-step dimming function, use the EN/DIM pin. Table 1 on page 3 shows the proposed resistor (R3) in E96 series for different dimming duty cycles. When EN/DIM is high, the dimming duty cycle is 100%; when EN/DIM is low, the dimming duty cycle percentage varies.

QUICK START GUIDE *(continued)*

Table 1: Two-Step Dimming Duty vs. R3

Two-Step Dimming Duty	R3 (Ω)
15%	61900
14%	41200
13%	27400
12%	18200
11%	12100
10%	7870
Two-step dimming off	4870
9%	3090
8%	2050
7%	1370
6%	887
5%	576

9. The external resistor (R5) connected to the ISET pin sets the LED current (I_{LED}). R5 can be calculated using Equation (1):

$$R5 = \frac{16}{I_{LED}(A)} (k\Omega) \quad (1)$$
